Annali di Chimica applicata alla Medicina, July number, 1873.—We notice in this journal, besides a number of formulae for pharmaceutical preparations and other details interesting to the druggist, a paper by A. Gubler, on experiments with new and old opium alkaloids, which deals, amongst others, with apomorphia.—There is also a translation of Mr. Simon's memorandum on the diffusion of cholera, and other papers from native and foreign sources. In the *Rendiconto delle sessioni dell' Accademia delle scienze dell' Istituto di Bologna*, 1872-1873, are given briefly (in about 189 pages) abstracts of the papers read before the Society, together with other matter of the usual nature.

Rivista Istituto Lombardo di scienze e Lettere, November, Fascicolo xiv., July 1873.—This number contains several critical literary, historical, and philosophical papers, including one on Kant's philosophy, by C. Cantoni.—In the scientific section there is a paper by Prof. Cavalleri on improvements in the helioscope, and a portion of a paper by P. Cantoni on electrical adhesion, which is illustrated with several tables of data.—Fascicolo xiv. contains a paper on the capacity of the nasal fossa, by P. Mantegazza, and one on cholera, by G. Strambio.—C. Lombroso details some experiments on the tonic action of

maize (*guasto*) affected with the *Penicillium glaucum*. The author maintains that the maize in this state acts injuriously. G. Sangalli, who replies to the paper, maintains that the effects are due to another cause.—New comet discovered at the Royal Observatory of Milan, by G. Tempel; communicated by G. V. Schiaparelli.—The continuation of P. Canton's paper on electrical adherence is given.—The other papers are on the propagation of the corporeal cornelia, by C. Gibelli, and a letter on a purulent disease of one hemisphere of the brain, by L. Porta.

SOCIETIES AND ACADEMIES

PHILADELPHIA

Academy of Natural Sciences, June 3.—Dr. Ruschenberger in the chair.—"Fertilisation of *Pedicularis canadensis*." Mr. Thomas Meehan drew attention to the structure of the flower of *Pedicularis canadensis*, in which it was evident self-impregnation was impossible, and there seemed to be no special arrangements for fertilisation by distinct agency, as there were in so many allied plants. In this case the stamens were included in the closely compressed arch of the corolla, and with the anthers were directed retroversely to the pistil, which at an early stage, and long before the maturity of the pollen, was protruded beyond the corolla, rendering self-fertilisation almost impossible in this flower. But the flowers were always abundantly fertile, and though the arrangements were such as seemingly to afford no chance even for insects to aid in the fertilisation, it was also probable that in some way it was accomplished by them. Both last season and this he had devoted some time to watching the plant, but failed to find any clue to the process. A species of *Bombus* seemed to have the plant especially under its charge, visiting the flowers in great numbers; but they bored through the corolla on the outside of the tube for the saccharine matter, and the anthers or pollen did not seem to be in the least disturbed by this. Still it was so highly probable that in some way some insect aided in the cross-fertilisation of these flowers, that it might serve a useful purpose to direct attention to it, as others with time and opportunity might discover what he had failed to find.

RIGA

Society of Naturalists, April 16.—M. Tank communicated some observations on honeydew, which he thinks is an immediate excretion of the leaves due to cooling.—M. Behrmann gave reasons for supposing that certain fires which occurred almost daily from October to December last year, in a village of the Orel Government, arose from phosphuretted hydrogen out of the marshy ground.

April 23.—M. Petzholdt read a paper on the composition and formation of Imatra stones. Various hypotheses of formation have been given—the geyseric, the stalaictic, the geological, the vegetable, the animal, &c. Parrot supposed the stones to be petrified, shell-less molluscs. M. Petzholdt formulates his view thus.—In a slimy layer of fine sand, mud, and carbonate of lime, are formed, through mutual attraction of particles of the latter, several ball-heaps of lime. Next, dry deposition of the whole at a later epoch. Disturbance of the stratum by water, setting free the hard sphenical masses (Imatra stones).

April 30.—M. Pfeffer showed a small headless chick with large legs, found dead with another, which was alive in the same egg. The two were connected by a fibre. After separation the living chick thrived normally.

May 21.—M. Glavenapp gave a note on blackened wood in certain trees blown down in a storm. The blackening is attributed to a kind of fungus which formed on the north side of the trees while yet standing.—M. Gottfriedt read a paper on enclosure of diamonds in xanthophyllite; the supposed diamonds he finds to be merely hollow spaces, erosion figures.

M. Teich gave an account of an excursion to North-West of Kurland.—The *Correspondenz Blatt*, No. 9, contains a description of the snakes of the Baltic Provinces, of which there are three species—*Vipera verus*, *Tropidonotus natrix*, and *Coronella laceri*.

GOTTINGEN

Royal Academy of Sciences, Aug. 6.—Dr. Paul du Bois-Reymond communicated a paper on the representation of functions by Fourier's series.

Aug. 13.—M. Waite compared some points in the *Annales Sithiensis*, relative to Pippin and Charlemagne, with other

annals of the time.—M. Ewald gave a paper on the passage, Ezek. xiv. 12: "Twenty shekels, five-and-twenty shekels, ten-and-five shekels shall be your maneh." The maneh, it is known, originally contained 60 shekels (which these numbers make up), and this enumeration, he thinks, was in order to exactness and certainty, not because there were coins of these several values. The Septuagint version (rightly read) makes the maneh 50 shekels, and it is known there was such a maneh. The author advances a theory, on which the passage affords evidence of both manehs having been known in the first half of the sixth century B.C.—Dr. Voss communicated a note on the geometry of focal surfaces of congruences.

Aug. 20.—M. Minnigerode gave a long paper on a new method of solving Pell's Equation $x^2 - Dy = 1$.

PARIS

Academy of Sciences, October 6.—M. Bertrand in the chair.—The following papers were read.—Note on the means used to obtain a constant temperature in rooms and on the methods of moderating it during the heat of summer, by General Moyn.—On new propyl compounds, by M. A. Cahours.—The author described several ethers of the propyl series.—Certain considerations on the yellow elastic tissue and its immediate organic analysis, by M. Chevreul.—Treatment of carbuncle and malignant pustule by carbolic acid and ammoniac carbonate, by M. Déclat.—Statistical tables of the losses of German armies in France during the war of 1870–1, by Capt. D. H. Leclerc.—The subcutaneous infarctus of cholera, by M. Bouchut.—On the improvement in healthfulness caused by the growth of *Eucalyptus globulus* in marshes, by M. Gumbert.—Studies on the *Phylloxera*, by M. Max Cornu.—On the action on the vine of the carbonic disulphide used to destroy the *Phylloxera*, by M. Lescoq de Boulaurd.—On the size and variations of the sun's diameter, by S. Respighi.—The author in his letter criticised Secchi's statements as to the difference between the nautical almanac diameter and his own observations by monochromatic light. He regarded Secchi's observations as erroneous.—On the theory of the thrust of earthworks, by M. J. Curie.—On the condensation of gases and liquids by carbon, by M. Meisens.—The author noticed the thermal phenomena produced by the contact of the liquids with carbon, &c.—On the production of certain borates in the dry way, by M. Ditté.—Researches on triboelectric acid, by M. H. Gal.—On the development of *Batrachians*. This was a note on the embryos of *Hydrola maritimus*, by M. Bavy.

PAMPHLETS RECEIVED

ENGLISH.—Synopsis of all the Mosses known to inhabit Ireland. David Moore, Ph.D.—Lobley's Geological Excursion to the Malvern District.—Proceedings of the Belfast Natural History Society for 1891.—Leyton Astronomical Observations.—Report, Chester Society of Natural Science.—Law of Elliptic Motion deduced from the Laws of Gravitation and Compound Rotation. G. Hamilton.—Milk, Typhoid Fever and Sewage Altered Sown.—Contributions to the Knowledge of the Meteorology of the Antarctic Regions.—A new Method of obtaining the Differentials of Functions, Prof. Rasm and Johnson.—Count Kumbord, the Banished Beggar from Bavaria. T. L. Nichols, M.D.—A Sampler across Europe. T. L. Nichols, M.D.

LIST OF SCIENTIFIC SOCIETIES
AND FIELD CLUBS

IN GREAT BRITAIN AND IRELAND.

The following list has been compiled mainly from information recently sent us by the Secretaries of the various Societies named. For obvious reasons the Chartered London Societies have been omitted, and in the meantime we have omitted the scientific societies connected with the public schools, a list of which we hope to be able to give in an early number. Corrections of the following list and any additional information are requested by the Editor. The letter (E) denotes that the number of members has been taken from the list appended to Sir Walter Elliot's Address to the Edinburgh Botanical Society (November 1872); *a* denotes that the Society is also a Field Club, and *b* that it issues regular or occasional publications.

County and Title of Society	When founded	No. of members
ENGLAND AND WALES		
<i>Berkshire</i>		
Reading Microscopical Society	1860	72
<i>ab</i> Newbury District Field Club	1870	98 (E)

LOCAL SCIENTIFIC SOCIETIES

I.

WE have devoted part of our space this week to a kind of Census of our Local Scientific Societies. It will be seen that in these Islands we already muster a goodly number, but no friend of Science would consider the number satisfactory, it does not, we are sure—seeing that there are twenty counties in England and Wales, and a much larger proportion in Scotland and Ireland, which appear not to boast of any such society—represent the true activity of the different regions from which, so to speak, the societies are fed. We do not suppose that our list is accurate, indeed our present purpose in printing it is to gather information. We hope that many societies exist which are not in our list; we fear that some have already ceased to exist since the time that Sir Walter Elliot, with infinite pains, compiled some of the data on which we have had to rely in the absence of information forwarded by the officers of the societies themselves.

On the whole, however, all lovers of Science and advocates for the spread of scientific education among all classes, ought to feel greatly gratified at the rapid increase during recent years, of local scientific societies and field-clubs indicated by the dates of foundation to be found in our list. No more unmistakable sign of a general elevation of taste, of the spread of the scientific influence and of a desire for scientific knowledge, can, we think, be obtained, than this starting-up, in all parts of the country, of societies for the express purpose of scientific work in one form or another, and that generally as a means of recreation. By far the greater number of the societies have had their birth within recent years. With one or two exceptions, the older societies are not very prominently scientific, while as a rule the recently founded ones bear on their very front the declaration that they have been established solely for the pursuit of Science.

This indeed very encouraging, more especially when we reflect that this result is no outcome of any temporary burst of enthusiasm, of any exciting scientific "revival" agitation, but is simply the natural fruit of the slow but sure development of the scientific spirit in our country.

From the information which has been kindly sent us by the secretaries of the various societies many interesting facts might be presented, and many curious and valuable inferences drawn. It will be seen from the list, that the societies are very unequally distributed over the country, quite a busy hive of them being clustered around the border counties of England and Scotland, while not a few counties in both countries, as well as in Ireland, are quite unrepresented, and many large counties by but a single society. Why should this be? Is it to be attributed to the backward state of intelligence and education in the unrepresented districts? We do not think so; we believe that in every county in the three kingdoms, men and women will be found with an intelligent love of Science, a desire for scientific knowledge, and a wish for the spread of scientific education. Such people only require to be roused to perceive the advantages of the establishment of scientific societies and field-clubs in their midst; if only some one would take the initiative and start such societies where they do not at present exist, we have no fear, if judicious means be used, that ample success will follow. From the large

number of members belonging to many of the societies members belonging to all classes of society, it will be seen that it is now considered honourable to be connected with such an association; and although in most societies there is only a small nucleus of working members, still while efforts should be made to engage all in the work, the non-working majority should be considered as, at least by their subscriptions and good-will, they help on the good cause.

Into these and other details we hope to enter in one or more future articles, founded partly on the statistics we possess. At the present time, when a Committee of the British Association is considering the whole question of our local Societies, we think it useful to point out the extreme importance of an increased activity in this direction. The recent action of the Government in aiding the establishment of Science Schools has enormously increased the advantages which such local associations may confer on outsiders, while at the same time it has greatly widened the recruiting ground. And it is in this double capacity that the formation, encouragement, and extension of such societies should be the care of all, whether scientific in their tastes or not, while, to friends of Science it is crucial, for Government aid, under existing arrangements, can only come where there are Science Classes; and without Government aid, in nine cases out of ten, the thing will fall to the ground altogether, or drag on an existence of second-rate utility.

If there then be any Scientific Societies without Science Classes attached to them, let them be assured that their museums are comparatively valueless; and further, that their museum must always remain as it is, for though it is clear to many that the Government must soon supply typical collections to museums which are available for teaching purposes, it is equally clear that there is no reason why they should do so to museums the utility of which is limited merely to members of a society.

Again. If there be any Scientific Societies without Science Classes attached to them let them be assured that their courses of lectures will prove of the least possible value; for mere lectures to those anxious to learn, but who are debarred from more serious study, are more than disappointing, they are hurtful.

In the ordinary course of things the Lecture should be the precursor of the Science Class. The Science Class should drive the student to the Museum, and from the zealous students the society should be recruited.

There is one point in which all will acknowledge our local societies have of late made considerable progress, and here again the British Association has been helpful to them—we refer to the more general establishment of courses of lectures, and the more general engagement of competent men of science, to place things new and strange before their members. Let not such lecturers forget that their duty is almost a sacred one; though he may not be a Davy, there may yet be a Faraday among the audience, one who may be gained or lost to Science according as the lecturer does his allotted work well or ill.

This brings us to another point. Why should not physical and chemical apparatus available for high-class experimental lectures be occasionally seen in our museums or in rooms adjoining them? Why should the stuffed crocodile and curious weapon of some

southern race of savages have it all their own way to the extent that they do? Here, no doubt, our Government has been greatly at fault, for after all, humble local museums, *parvus componere magna*, are little British Museums, and there is no help provided by the government for any physical, or chemical, or astronomical students in the British Museum. But though our government is behind the age in London, the South Kensington authorities are alive to the weak point in the armour, as regards the provinces, and if a local society will only establish a Science Class, travelling collections of the most important modern scientific instruments are to be had for the asking; and we may hope that ere long there may be a model museum at South Kensington, doing for physical science what is done for it in Paris by the magnificent *Conservatoire des Arts et Meters*, a museum in which the applications of Science, and the implements for the teaching of Science hold the first place.

FARADAY ON SCIENTIFIC LECTURING

AT a time when the lecture season is commencing, we believe we shall be doing good service by placing before those of our readers who are not already acquainted with them in Dr Benze Jones' "Life of Faraday," the opinions of that great man on many points connected with lectures on Science.

They were written to a friend when Faraday was but 21 years of age, but we believe he would have changed little though he might have added much if he had revised them in his later years. He commences by explaining that --

"The subject upon which I shall dwell more particularly at present has been in my head for some considerable time, and it now bursts forth in all its confusion. The opportunities that I have latterly had of attending and obtaining instructions from various lecturers in their performance of the duty attached to that office, has enabled me to observe the various habits, peculiarities, excellencies, and defects of each of them as they were evident to me during the delivery. I did not wholly let this part of the things occur to escape my notice, but when I found myself pleased, endeavoured to ascertain the particular circumstance that had affected me, also, whilst attending Mr. Brand and Mr. Powell in their lectures, I observed how the audience were affected, and by what their pleasure and their censure were drawn forth.

"On going to a lecture I generally get there before it begins; indeed, I consider it as an impropriety of no small magnitude to disturb the attention of an audience by entering amongst them in the midst of a lecture, and, indeed, bordering on an insult to the lecturer. By arriving there before the commencement, I have avoided this error, and have had time to observe the lecture-room."

He dwells on the form of the lecture-room, and then indicates how important a matter ventilation is.

"There is another circumstance to be considered with respect to a lecture-room of as much importance almost as light itself, and that is ventilation. How often have I felt oppression in the highest degree when surrounded by a number of other persons, and confined in one portion of air! How have I wished the lecture finished, the lights extinguished, and myself away merely to obtain a fresh supply of that element! The want of it caused the want of attention, of pleasure, and even of comfort, and was not regained without its previous admission. Attention to this is more particularly necessary in a lecture-room intended for night delivery, as the lights burning

add considerably to the oppression produced on the body."

He then goes on --

"Having thus thrown off, in a cursory manner, such thoughts as spontaneously entered my mind on this part of the subject, it appears proper next to consider the subject fit for the purposes of a lecture. Science is undeniably the most eminent in its fitness for this purpose. There is no part of it that may not be treated of, illustrated, and explained with profit and pleasure to the hearers in this manner. The facility, too, with which it allows of manual and experimental illustration, places it foremost in this class of subjects. After it come (as I conceive) arts and manufactures, the polite arts, belles lettres, and a list which may be extended until it includes almost every thought and idea in the mind of man, politics excepted. I was going to add religion to the exception, but remembered that it is explained and laid forth in the most popular and eminent manner in this way. The fitness of subjects, however, is connected in an inseparable manner with the kind of audience that is to be present, since excellent lectures in themselves would appear absurd if delivered before an audience that did not understand them. Anatomy would not do for the generality of audiences at the R. I. (Royal Institution), neither would metaphysics engage the attention of a company of schoolboys. Let the subject fit the audience, or otherwise success may be despaired of."

Now for the lecturer:--

"A lecturer may consider his audience as being polite or vulgar (terms I wish you to understand according to Shuffleton's new dictionary), learned or unlearned (with respect to the subject), listeners or gazers. Polite company expect to be entertained not only by the subject of the lecture, but by the manner of the lecturer; they look for respect, for language consonant to their dignity, and ideas on a level with their own. The vulgar--that is to say in general, those who will take the trouble of thinking, and the bees of business--wish for something that they can comprehend. This may be deep and elaborate for the learned, but for those who are as yet tyros and unacquainted with the subject must be simple and plain. Lastly, listeners expect reason and sense, whilst gazers only require a succession of words.

"These considerations should all of them engage the attention of the lecturer whilst preparing for his occupation, each particular having an influence on his arrangements proportionate to the nature of the company he expects. He should consider them connectedly, so as to keep engaged completely during the whole of the lecture the attention of his audience.

"I need not point out to the active mind of my friend the astonishing disproportion, or rather difference, in the perceptive powers of the eye and the ear, and the facility and clearness with which the first of these organs conveys ideas to the mind--ideas which, being thus gained, are held far more retentively and firmly in the memory than when introduced by the ear. 'Is true the ear here labours under a disadvantage, which is that the lecturer may not always be qualified to state a fact with the utmost precision and clearness that language allows him and that the ear cannot understand, and thus the complete action of the organ, or rather of its assigned portion of the sensorium, is not called forth, but this evidently points out to us the necessity of aiding it by using the eye also as a medium for the attainment of knowledge, and strikingly shows the necessity of apparatus.

"Apparatus, therefore, is an essential part of every lecture in which it can be introduced; but to apparatus should be added, at every convenient opportunity, illustrations that may not perhaps deserve the name of apparatus and of experiments, and yet may be introduced with considerable force and effect in proper places. Diagrams, and tables too, are necessary, or at least add in an

eminent degree to the illustration and perfection of a lecture. When an experimental lecture is to be delivered, and apparatus is to be exhibited, some kind of order should be observed in the arrangement of them on the lecture-table. Every particular part illustrative of the lecture should be in view, no one thing should hide another from the audience, nor should anything stand in the way of or obstruct the lecturer. They should be so placed, too, as to produce a kind of uniformity in appearance. No one part should appear naked and another crowded, unless some particular reason exists and makes it necessary to be so. At the same time, the whole should be so arranged as to keep one operation from interfering with another. If the lecture-table appears crowded, if the lecturer (hid by his apparatus) is invisible, if things appear crooked, or aside, or unequal, or if some are out of sight, and this without any particular reason, the lecturer is considered (and with reason too) as an awkward contriver and a bungler.

"The most prominent requisite to a lecturer, though perhaps not really the most important, is a good delivery, for though to all true philosophers science and nature will have charms innumerable in every dress, yet I am sorry to say that the generality of mankind cannot accompany us one short hour unless the path is strewn with flowers. In order, therefore, to gain the attention of an audience (and what can be more disagreeable to a lecturer than the want of it?), it is necessary to pay some attention to the manner of expression. The utterance should not be rapid and hurried, and consequently unintelligible, but slow and deliberate, conveying ideas with ease from the lecturer, and infusing them with clearness and readiness into the minds of the audience. A lecturer should endeavour by all means to obtain a facility of utterance, and the power of clothing his thoughts and ideas in language smooth and harmonious, and at the same time simple and easy. His periods should be round, not too long or unequal, they should be complete and expressive, conveying clearly the whole of the ideas intended to be conveyed. If they are long, or obscure, or incomplete, they give rise to a degree of labour in the minds of the hearers which quickly causes lassitude, indifference, and even disgust.

"With respect to the action of the lecturer, it is requisite that he should have some, though it does not here bear the importance that it does in other branches of oratory; for though I know of no species of delivery (divinity excepted) that requires less motion, yet I would by no means have a lecturer glued to the table or screwed on the floor. He must by all means appear as a body distinct and separate from the things around him, and must have some motion apart from that which they possess.

"A lecturer should appear easy and collected, undaunted and unconcerned, his thoughts about him, and his mind clear and free for the contemplation and description of his subject. His action should not be hasty and violent, but slow, easy, and natural, consisting principally in changes of the posture of the body, in order to avoid the air of stiffness or sameness that would otherwise be unavoidable. *His whole behaviour should evince respect for his audience, and he should in no case forget that he is in their presence.* No accident that does not interfere with their convenience should disturb his serenity, or cause variation in his behaviour; he should never, if possible, turn his back on them, but should give them full reason to believe that all his powers have been exerted for their pleasure and instruction.

"Some lecturers choose to express their thoughts extemporaneously immediately as they occur to the mind, whilst others previously arrange them, and draw them forth on paper. Those who are of the first description are certainly more unengaged, and more at liberty to attend to other points of delivery than their pages; but as

every person on whom the duty falls is not equally competent for the prompt clothing and utterance of his matter, it becomes necessary that the second method should be resorted to. This mode, too, has its advantages, inasmuch as more time is allowed for the arrangement of the subject, and more attention can be paid to the neatness of expression.

"But although I allow a lecturer to write out his matter, I do not approve of his reading it; at least, not as he would a quotation or extract. He should deliver it in a ready and free manner, referring to his book merely as he would to copious notes, and not confining his tongue to the exact path there delineated, but digress as circumstances may demand or localities allow.

"A lecturer should exert his utmost effort to gain completely the mind and attention of his audience, and irresistibly to make them join in his ideas to the end of the subject. He should endeavour to raise their interest at the commencement of the lecture, and by a series of unperceptible gradations, unnoticed by the company, keep it alive as long as the subject demands it. No breaks or digressions foreign to the purpose should have a place in the circumstances of the evening, no opportunity should be allowed to the audience in which their minds could wander from the subject, or return to inattention and carelessness. A flame should be lighted at the commencement, and kept alive with unemitting splendour to the end. For this reason I very much disapprove of breaks in a lecture, and where they can by any means be avoided, they should on no account find place. If it is unavoidably necessary, to complete the arrangement of some experiment, or for other reasons, leave some experiments in a state of progression, or state some peculiar circumstance, to employ as much as possible the minds of the audience during the unoccupied space—but, if possible, avoid it.

"Digressions and wanderings produce more or less the bad effects of a complete break or delay in a lecture, and should therefore never be allowed except in very peculiar circumstances, they take the audience from the main subject, and you then have the labour of bringing them back again (if possible).

"For the same reason (namely that the audience should not grow tired), I disapprove of long lectures; one hour is long enough for anyone, nor should they be allowed to exceed that time.

"A lecturer falls deeply beneath the dignity of his character when he descends so low as to *angle for claps*, and *asks for commendation*. Yet have I seen a lecturer even at this point. I have heard him causelessly condemn his own powers. I have heard him dwell for a length of time on the extreme care and niceness that the experiment he will make requires. I have heard him hope for indulgence when no indulgence was wanted, and I have even heard him declare that the experiment now made cannot fail from its beauty, its correctness, and its application, to gain the approbation of all. Yet surely such an error in the character of a lecturer cannot require pointing out, even to those who resort to it, its impropriety must be evident, and I should perhaps have done well to pass it.

"Before, however, I quite leave this part of my subject, I would wish to notice a point in some manner connected with it. In lectures, and more particularly experimental ones, it will at times happen that accidents or other incommencing circumstances take place. On these occasions an apology is sometimes necessary but not always. I would wish apologies to be made as seldom as possible, and generally, only when the inconvenience extends to the company. I have several times seen the attention of by far the greater part of the audience called to an error by the apology that followed it.

"An experimental lecturer should attend very carefully to the choice he may make of experiments for the illus-

tration of his subject. They should be important, as they respect the science they are applied to, yet clear, and such as may easily and generally be understood. They should rather approach to simplicity, and explain the established principles of the subject, than be elaborate and apply to minute phenomena only. I speak here (be it understood) of those lectures which are delivered before a mixed audience, and the nature of which will not admit of their being applied to the explanation of any but the principal parts of a science. If to a particular audience you dwell on a particular subject, still adhere to the same principle, though perhaps not exactly to the same rule. Let your experiments apply to the subject you elucidate, do not introduce those which are not to the point.

"Though this last part of my letter may appear superfluous, seeing that the principle is so evident to every capacity, yet I assure you, dear A., I have seen it broken through in the most violent manner—a mere alchouse trick has more than once been introduced in a lecture, delivered not far from Pall Mall, as an elucidation of the laws of motion.

"Neither should too much stress be laid upon what I would call small experiments, or rather illustrations. It pleases me well to observe a neat idea enter the head of a lecturer, the which he will immediately and aptly illustrate or explain by a few motions of his hand—a card, a lamp, a glass of water, or any other thing that may be by him; but when he calls your attention in a particular way to a decisive experiment that has entered his mind, clear and important in its application to the subject, and then lets fall a card, I turn with disgust from the lecturer and his experiments. 'Tis well, too, when the lecturer has the ready wit and the presence of mind to turn any casual circumstance to an illustration of his subject. Any particular circumstance that has become table-talk for the town, any local advantages or disadvantages, any trivial circumstance that may arise in company, give great force to illustrations aptly drawn from them, and please the audience highly, as they conceive they perfectly understand them.

"Apt experiments (to which I have before referred) ought to be explained by satisfactory theory, or otherwise we merely patch an old coat with new cloth, and the whole (hole) becomes worse. If a satisfactory theory can be given, it ought to be given. If we doubt a received opinion, let us not leave the doubt unnoticed, and affirm our own ideas, but state it clearly, and lay down also our objections. If the scientific world is divided in opinion, state both sides of the question, and let each one judge for himself, by noticing the most striking and forcible circumstances on each side. Then, and then only, shall we do justice to the subject, please the audience, and satisfy our honour, the honour of a philosopher."

We trust that during the ensuing session, these opinions of Faraday may be in the minds of every lecturer on Science.

ECKER'S "CONVOLUTIONS OF THE BRAIN"

On the Convolution of the Human Brain. By Dr. Alexander Ecker, Professor of Anatomy and Comparative Anatomy in the University of Freiburg, Baden. Translated, by permission of the author, by John C. Galton, M.A., Oxon., M.R.C.S., F.L.S., &c., &c. Translator of Prof. Roser's "Manual of Surgical Anatomy," &c. (London: Smith, Elder, & Co., 1873.)

OF late years the topographical anatomy of the surface of the brain has deservedly attracted considerable attention; and the recent able investigations of Huxtings

Jackson and Ferrier have shown the importance, in fact the absolute necessity of a correct and generally recognised description and enumeration of the cerebral convolutions. Mr. Galton therefore deserves the thanks of all interested in the subject, for having introduced to us in English dress this valuable monograph by Prof. Ecker of Freiburg.

There are two methods by which the complex human brain may be analysed and reduced to its simpler elements, two paths that lead to the same goal, the one is by a careful examination and comparison of the brains of the lower animals, and especially of apes, which latter in their higher groups present a "sketch map" as it were, which is filled in and completed in man only. This has been carried out with great success by Gratiolet primarily, and in England it has been followed amongst others by Huxley, Marshall, Flower and Rolleston. The other method is by tracing the development of the fetal brain, and observing which fissures, and therefore which convolutions, are the first to make their appearance, and so are of primary importance, and how these subsequently undergo farther evolution and complication. Tiedemann and Reichert have hitherto been our authorities on this point, and it is by this method chiefly that Prof. Ecker arrives at his conclusions.

In this country the admirable little treatise of Prof. Turner has been welcomed and the classification therein adopted is now generally accepted, and taught in several of our anatomical schools. Prof. Ecker in the main follows Prof. Turner, although the nomenclature, of course, is that of the German school, and so differs occasionally from ours, which follows rather Gratiolet and the French school. The synonyms are, however, in all cases faithfully given.

The author insists upon the essential difference between the Sylvian fissure and the other sulci, these being mere indentations of the cortex, whilst that is formed by the folding of the temporo-sphenoidal lobe on the fore part of the brain during its development. The anterior or ascending branch of this fissure, is here correctly described as being short and arrested by the hinder end of the lower frontal convolution, whilst that described as such by Prof. Turner is a distinct sulcus (precentral) terminating close behind the ascending ramus. The gyrus connecting the inferior and ascending frontal (anterior central) convolutions is always present, although it is not always superficial, being occasionally concealed by the over-lapping of those convolutions. Instead of the orbital lobule usually described on the under surface of the frontal lobe, the three frontal convolutions are traced round the apex to the orbital surface. The narrow ridge internal to the olfactory sulcus (gyrus rectus) is regarded as the continuation of the first, the gyrus between that and the orbital sulcus as the second, and outside the last as the third. We should rather consider all internal to the orbital sulcus as first frontal, which is grooved by a special olfactory sulcus, and the second as ending posteriorly between the anterior branches of the triradiate orbital sulcus. The marginal convolution is regarded as simply the inner surface of the superior frontal.

In the parietal lobe the supra-marginal and angular convolutions are amongst the most difficult in the brain to indicate and circumscribe. Prof. Ecker describes the

supra-marginal convolution as arching over the end of the fissure of Sylvius and joining the upper temporo-sphenoidal convolution, and the angular as folding over the hinder end of the parallel fissure and joining the middle temporo-sphenoidal convolution. This description, and it is supported by our experience, is not quite in accordance with that of some other anatomists, for instance, in Mr. Marshall's well-known essay on the brain of the bushwoman, the supra-marginal convolution is correctly defined thus, whilst the angular would require the anterior enlarged portion of the third annectent gyrus, as marked in the figure, to complete its bend and unite it to the second temporal gyrus. Similarly, in the idiot boy's brain, the angular gyrus would be a large folded convolution, there indicated as the bifurcated anterior extremity of the second annectent convolution, and in the idiot woman the parallel fissure extends so far back that it quite cuts off the angular gyrus from the temporo-sphenoidal, and the convolution is represented by the straight, also bifurcated fore part of the second annectent gyrus in the figure. The intra-parietal fissure of Turner is here called less correctly inter-parietal.

In the occipital lobe, a tolerably constant transverse depression, into which the intra-parietal fissure often debouches is appropriately named "occipital sulcus." Prof. Ecker regards the bridging, or annectent convolutions, as unworthily distinguished by special names in the human brain, since they do not bridge over any fissure as in the lower apes. He carefully points out their homology with those gyri in the ape, yet depreciates the transference of the names from the Simian to the human brain. But this comparison and correspondence of nomenclature is precisely what we require for the satisfactory determination of the cerebral functions, and the homological significance of a part is quite sufficient to justify the application of the same name to it. So also, on the inner surface, the lower annectent gyrus is described as the "gyrus cuneus," and the occasional presence of the upper annectent gyrus is alluded to, of which we have now seen several examples. The operculum of the ape's brain is discussed, but the same term is unfortunately here applied to quite a different part of the human brain, viz the united lower ends of the ascending, frontal and parietal convolutions which overhang the island of Reil.

The middle convolution on the under surface of the occipito-temporal lobes is regarded, not without precedent, as the direct continuation of the gyrus fornicatus, and the uncinate gyrus of Huxley thus comes to be divided into three parts, the "lingual lobule" behind the union of the two gyri, the "convolution of the Hippocampus" immediately below the dentate fissure, and the recurved hook or "uncinate lobule"; but the connection between the gyrus fornicatus and this convolution is small and narrow, whilst that between it and the lingual lobule is large and direct; further, the author points out, after Gratiolet, that in many apes the calcarine is prolonged into the dentate fissure and cuts off the arched from the uncinate gyrus; surely this shows the essential unity of the uncinate convolution, and that the junction with the gyrus fornicatus is a superadded and secondary element in the human and certain Simian brains.

The translator has generally performed his work well, there are, however, one or two slips; for instance, the

dentate fissure is said to produce an eminence in the floor of the posterior corner of the lateral ventricle; the parieto-occipital fissure also is described correctly as being concave forwards, whilst in the diagram it is represented as convex the figures are exceedingly clear. Prefixed is an exhaustive bibliography by the translator, which adds materially to the value of the work, and finally, we can cordially recommend it as an accurate and lucid guide to a somewhat difficult study.

G. D. T.

OUR BOOK SHELF

The Zoological Record for 1871. Edited by Prof. Newton. (J. Van Voorst, 1873.)

THE birth of true biological science is of so recent origin, and its development has been so rapid that until lately many of the necessary steps in the furtherance of its proper progress have remained beyond the cognizance of its most enthusiastic followers. The difficulties connected with, and the unmanageableness of the large number of facts accumulated day by day on all branches of zoology, and recorded by observers in all parts of the civilised world, have until lately been scarcely realised. Only by those who, from the disappointment which they have experienced on finding that observations which have cost them incalculable time and labour, have been previously undertaken and exhausted by others before them, either in their own or some other country, appreciate fully the necessity for an easily accessible, accurate, and not over ponderous account of the labours of previous workers.

It is only the full appreciation of the advantage to future science students which stimulates the authors of the several parts of the work before us to continue and commence their contributions to this, what may be truly termed, labour of love. The labour involved in obtaining a complete and condensed account of the gist of each zoological paper published here or elsewhere throughout a year, is so great, and the smallness of the class who are disposed to purchase the work when produced, so necessarily restricted, that at first sight it is evident that it is only with the assistance of donations from scientific bodies, or from contributions of one kind or another on the part of amateurs in the subject, that the necessary expenses can be covered and the staff maintained.

These considerations will recommend this valuable work to the consideration of all interested in zoological progress.

LETTERS TO THE EDITOR

[The Editor does not hold himself responsible for opinions expressed by his correspondents. No notice is taken of anonymous communications.]

On the Equilibrium of Temperature of a Gaseous

Column subjected to Gravity

SINCE reading Principal Guthrie's first letter on this subject (vol. viii p. 67), I have thought of several ways of investigating the equilibrium of temperature in a gas acted on by gravity. One of these is to investigate the condition of the column as to density when the temperature is constant, and to show that when this is fulfilled the column also fulfils the condition that there shall be no upward or downward transmission of energy, or, in fact, of any other function of the masses and velocities of the molecules. But a far more direct and general method was suggested to me by the investigation of Dr. Ludwig Boltzmann* on the final distribution of energy in a finite system of elastic bodies. A sketch of this method as applied to the simpler case of a number of molecules so great that it may be treated as infinite, will be found on p. 535. Principal Guthrie's second letter (vol. viii p. 486) is especially valuable as stating his case in the form of distinct propositions, every one of

* Studien über das Gleichgewicht der lebendigen Kraft zwischen bewegten materiellen Punkten. Von Dr. Ludwig Boltzmann. Sitzb. d. Akad. d. Wissensch., October 8, 1868 (Vienna).

which, except the fifth, is incontrovertible. He has himself pointed out that it is here that we differ, and that this difference may ultimately be traced to a difference in our doctrine as to the distribution of velocity among the molecules in any given portion of the gas. He assumes, as Clausius, at least in his earlier investigations, did, that the velocities of all the molecules are equal, whereas I hold, as I first stated in the *Phil. Mag.* for Jan. 1866, that they are distributed according to the same law as errors of observation are distributed according to the received theory of such errors.

It is easy to show that if the velocities are all equal at any instant they will become unequal as soon as encounters of any kind, whether collisions or "perihelion passages" take place. The demonstration of the actual law of distribution was given by me in an improved form in my paper on the Dynamical Theory of Gases, "Phil. Trans." 1866, and *Phil. Mag.* 1867, and the far more elaborate investigation of Boltzmann has led him to the same result. I am greatly indebted to Boltzmann for the method used in the latter part of the sketch of the general investigation (see p. 535) which was communicated in a condensed form to the British Association on Sept. 20, 1873.

J. CLERK MAXWELL.

Mallet-Palmieri's Vesuvius

AS I am assured that it would be most unpleasing as well as unbecoming of me to continue a scientific controversy in the tone of Mr. Mallet's letter which appeared in *NATURE* of October 9, I would only beg those who have pursued it to remember that my remarks were altogether directed to the assertions contained in Mr. Mallet's introductory sketch, and not comments upon his theory of volcanic energy of which, as he himself admits, we as yet know little or nothing. I would then ask them to compare its contents with the substance of my letter in *NATURE*, Sept. 4, and judge for themselves whether so far from its being any answer to my arguments, it does not, on the contrary, furnish additional "evidence of his confounding chemical constitution with percentage composition, &c.," the very keynote of this discussion.

Mr. Mallet writes—"Mr. Forbes appears to think that chemists, mineralogists, and geologists are the sole arbiters" of such questions, a remark he could not have made had he read some of my publications, yet I am quite willing to admit that I do place more faith in them collectively, than in any one physicist or mere mechanician whether theoretical or practical, and I believe I am correct in asserting that no theory of volcanoes will be accepted by the scientific world until its doctrines are proved to be fully in accordance with the facts brought forward by these sciences.

When the reasons for my delay in answering Mr. Mallet's criticisms were fully stated, it is not, to say the least, most unjust of him to harp on this string, after having already taken more than a month to produce a rejoinder the reverse of an answer, and the style of which, peculiar to himself, is in complete harmony with that of his introductory sketch, of which one of his favourite reviewers writes—"We do not cordially approve of his method of dealing with other writers. There is, if we may be excused the expression, a tone of bitterness all through his writing which gives the reader a most uncomfortable sensation, and leads a person altogether unbiassed to imagine a feeling of jealousy on the part of so distinguished a writer as Mr. Mallet, which we are sure cannot exist in reality." After giving a sketch of the various authors who have ventured to give different and erroneous opinions on the subject of volcanicity," &c. Another reviewer remarks that—"While objecting to most of the views of geologists, which, however, he frequently distorts, Mr. Mallet claims the character of physical truth for his own ideas," and adds, "what we chiefly object to in this portion of the volume is the assumption on Mr. Mallet's part of a conscious superiority to others, and a freely expressed contempt for all previous observers, especially for geologists." Need I add more?

DAVID FORBES

11, York Place, W. Oct. 20

Oxford Science Fellowships

AS Mr. Perry's letter, in the last number of *NATURE*, contains assertions calculated to impede the progress of science here by deterring persons, not graduates of Oxford, from competing for appointments in colleges, and also involves charges of, to say the least, discourtesy to himself, I trust you will find space in your next number for the following explanation.

First, as to Mr. Perry's general assertion respecting fellowships. From the fact that a graduate of Belfast is ineligible for a Fellowship in *Merton College*, Mr. Perry infers that "outsiders are ineligible for Oxford Fellowships in Physical Science." This is clearly illogical, and it is also untrue.

Secondly, as to the special case of Mr. Perry.

The ordinances of Merton College state that "no person shall be eligible" for a fellowship "who shall not have passed all the examinations required by the University for the degree of Bachelor of Arts." It appears a possible interpretation that Cambridge and Dublin B.A.'s, who can at any time incorporate in this University, may be candidates. If this be so, the reply of the Warden of Merton, as Mr. Perry gives it (of the actual correspondence I know nothing), may be correct, though perhaps not sufficiently explicit. This, however, is a legal question, and the college is taking steps to obtain the opinion of an eminent counsel.

Mr. Perry was not left, as his letter would naturally lead readers to infer, without warning as to this difficulty; for in July I wrote to Mr. Perry strongly expressing my doubt as to his eligibility, but as I was away from Oxford I could not quote the words of the ordinance, I advised him to consult the sub-warden, but I believe he did not follow my advice.

Mr. Perry received my letter, and replied to it on July 27. The great difficulties which Mr. Perry asserts to have been thrown in his way, simply arose from the fact that he only proposed to come to Oxford during the vacation. Now it is not to be expected that I should allow any person who chooses to apply to overhaul the physical apparatus of the University in my absence, and it is unreasonable to suppose that, to suit the convenience of such a person, I must give up engagements made long before, in order to assist him in a candidature for an office of emolument in a college.

It must be borne in mind that there are nineteen colleges, any one of which may at any time offer a fellowship for proficiency in physics, and consequently to have to be at the service of outsiders, who in my wish to be candidates, during the long vacation (the only time I have for real study) might become a serious matter, and to ask for such assistance seems to me to make a most unreasonable request.

I must add that if Mr. Perry imagines he would have been at any appreciable disadvantage by not knowing the particular ordinances of the University (which it is by no means certain would be used for a college examination), either he assumes that the examiners would be guilty of the absurdity and unfairness of puzzling candidates by new or peculiar apparatus, or he feels very uncertain about his own practical knowledge.

A Cambridge B.A. is a candidate for the Merton Fellowship, and I have every reason to think that he found the Oxford examinations on exactly equal terms with himself in the practical examination.

11 B. CLIFF

Oxford, Oct. 18

P.S.—Since writing the above I have been informed that a Cambridge graduate has been elected to a Science Fellowship in Magdalen College, Oxford. This is a proof of the inaccuracy of Mr. Perry's statement as to the ineligibility of outsiders for Oxford Fellowships.

Harmonic Echoes

I BELIEVE the echo observed by W. J. M. is of a different nature from mine and more analogous to one described by Oppel (*Popg. Ann.* xcv. 357, 539). Each bar of the railing, when struck by the aerial pulse, divers a small portion, which is scattered in all directions, much as if the bar were itself the source of sound. These divergent pulses reach the ear of the observer at approximately equal intervals, and accordingly blend into a musical note, whose pitch, however, may not be quite constant. Oppel discusses the effect of different positions of the original source and the observer with respect to the grating, on which alone the pitch and its variations depend. It is evident that an echo formed in this way is in no sense *selective*.

I have been asked several times how the Bedgebury echo would be affected by the character of the original sound. Of course, if my theory is correct, the octave could not be returned, unless it were originally present; but the intensity of the echo was too feeble to give any promise of a successful observation with such an instrument as the clarnet. The experiment would be most interesting if a more powerful echo of the same class could be found.

Deep-sea Soundings and Deep-sea Thermometers

We feel sure you will not deny us space in your valuable periodical, when we tell you that, however unconsciously on your part, you, as well as other scientific authorities, are the means of doing us injustice and much professional injury, by the capricious allusions to the so-called Casella Miller Thermometer, now used in all deep-sea investigations. We are certain that we have only to call your attention to the real facts of the case for you to set the matter right before your readers.

1 We beg to state that in the year 1857 we invented, made, and supplied the Meteorological Department of the Board of Trade with upwards of fifty instruments of this description.

2 This thermometer we called the Double Bulb Deep Sea Thermometer, and a notice of it was published in the first number of the Meteorological Papers for the year 1857.

3 This thermometer, identical in every respect (except in its size), has been, after a lapse of some twelve years, re-invented and ushered before the scientific world with all the prestige of having a paper read upon it by the Vice-President of the Royal Society, Dr. Miller, who declared that he had just invented the instrument, in which task (of inventing an instrument well-known to all leading instrument makers, and Mr. Casella among the number) the learned doctor says he was assisted by Mr. Casella (see Proceedings of the Royal Society, No. 113, page 482).

4 Annexed is an extract from Dr. Miller's paper describing the instrument, and by its side we give an extract from a treatise published by us in the year 1864, called "A Treatise on Meteorological Instruments."

Extract from "The Proceedings of the Royal Society," vol. xvi page 483 Paper read June 3, 1869, by Dr. Miller.

"The expedient adopted for protecting the thermometer from the effects of pressure consisted simply in enclosing the bulb of such a Six's thermometer in a second or outer glass tube, which was fused upon the stem of the instrument."

"This outer glass tube was nearly filled with alcohol, leaving a little space to allow of variation in bulk due to expansion."

"The spirit was heated to displace part of the air by means of its vapour, and the outer tube and its contents were sealed hermetically."

5 We leave you readers to draw their own conclusions as to the similarity of the two instruments. Dr. Miller, when we called his attention to the fact of our prior claim, stated that he was not aware of the existence of our instrument, and we freely acquit Dr. Miller of conscious plagiarism, but we cannot omit to state, at the same time, that at the date at which Dr. Miller's paper was read, any scientific instrument maker worthy of the name was fully acquainted with our arrangement.

6 In order to prove what we thought of our instruments and as to their fitness for the purpose they were intended, when we were written to by the Meteorological Committee, three or four years ago, to produce a thermometer to be submitted to them for approval, we replied that we had already produced the only thermometer which in our opinion would answer the purpose, and that the thermometer was well known to them, we also said we were ready to make that instrument smaller, or larger, but that we could not possibly produce a better one.

Holborn Viaduct, E.C.

October 14

Extract from "Nuggetti and Zambra's Treatise on Meteorological Instruments," published 1864, page 90 —

"The usual Six's thermometers have a central reservoir or cylinder containing alcohol. This reservoir, which is the only portion of the instrument likely to be affected by pressure, has been in Nuggetti and Zambra's new instrument superseded by a strong outer cylinder of glass containing mercury and rarefied air, by this means the portion of the instrument susceptible of compression has been so strengthened that no amount of pressure can possibly make the instrument vary."

Settle Caves Report

IN your abstract of the "Report of the Committee for exploring the Victoria Cave at Settle, by B. Boyd Dawkins, F.R.S.," vol. viii p. 476, are the following sentences. "The exact age of the Cave-earth is a matter of dispute. Mr. Tiddeman from the physical evidence alone regards it as preglacial, or rather as older than the great ice-sheet of that district."

Now it is true that in the spring of 1871, at a meeting of the Settle Caves Committee, I suggested the probability of the beds of lower Cave earth in the Victoria Cave being of preglacial age from the physical evidence in the cave alone, but at a committee meeting at Settle soon after I had much stress upon the impossibility of any animals, existing before the time of the ice-sheet, having their remains preserved in the open country, although it was very likely that they might be found sealed up in sheltered caves. Acting on this idea the committee, notwithstanding some opposition, fortunately determined upon continuing their researches, and the result was the interesting discovery of the older mammals.

May 1 be permitted to cite the following paragraph from the *Geological Magazine* of Jan. 1873, to show that I do not rely upon the physical evidence in the cave alone as determining the age of the lower cave-earth, although I confess that evidence, to my mind, is almost conclusive. "Perhaps one of the strongest pieces of evidence that the older cave mammals mentioned lived in this district only at a time previous to the great ice-sheet is, that so far as we know the remains of none of them (except of *Cetus elephas*, which ranges from the Forest-bed to the present day) have been found in any of the Post-glacial deposits in this district. Though so common in the river-gravels in the Midland and Southern counties, they are never found except in caves until we get much farther south or east. Leeds, I believe, is the nearest locality where they occur. This would seem to imply that their remains were wiped off the area by the great ice-sheet which occupied what is now the Irish Sea and its tributary river-systems, and only left in the shelter of caves to which it could have no direct access. Shown bear, horse, red deer, reindeer, meagrow, the more modern Howley, and other more recent forms are not uncommon in the Post-glacial beds, but the older cave mammals seen conspicuous only by their absence."

Clapham, Lancaster, Oct. 6

R. H. TIDDEMAN

Carbon Battery Plates

MR. T. W. FLETCHER will obtain what he requires from the India Rubber, Gutta Percha, and Telegraph Works Co., No. 100, Cannon Street, E.C.

I have 12,000 Carbons, or as we call them Graphite Plates, at work at this moment and for some years past have obtained them solely from the above Company.

London, Oct. 14

CHARLES V. WALKER

ASTRONOMICAL ALMANAC *

III — Foundation of the *Nautical Almanac*

DURING his voyage of 1761 to the island of Saint Helena, for the purpose of observing the transit of Venus, Maskelyne, like La Caille, investigated the methods for determining longitudes at sea, and on his return, in "The British Mariner's Guide" (1763), proposed to adopt the plan of an almanac sketched by the French astronomer. There existed at this time in England a commission instituted by George III. for the discovery of longitudes at sea,† it was a body almost analogous to the present French "Bureau des Longitudes." Maskelyne took many steps to induce this Commission to approve of his proposition, and, at the same time, he commissioned several ship-captains to put it to the test. Their reports confirmed his assertions, and on February 9, 1765, Maskelyne presented to the Commissioner of Longitude a detailed report, in which, besides a complete exposition of the method and plan of a nautical almanac, he gave from the entries in the log-books the result of this new method. The proposition of the wise abbé was adopted, and Maskelyne was entrusted with the calculation and publication of the "Nautical Almanac

* Continued from p. 322

† The Commission was appointed by Act of Parliament on the discovery of longitude at sea, and for examining, trying, and judging of all Proposals, Experiments, and Inventions (in) relative to the same, and encouraging attempts to find a Northern Passage between the Atlantic and Pacific Oceans, and to approach the North-east Pole.

‡ It is found *in extenso* in the "New and Correct Tables of the Motions of the Sun and Moon," by Thomas Mayer London, 1770. Published by order of the Commissioner of Longitude.

and Astronomical Ephemeris." The Commissioners did more; they ordered the printing of the Tables of the Moon, left by Tobias Mayer, according to which the lunar distances were to be calculated. At the same time parliament voted a sum of 3,000*l.* to the widow of the astronomer of Göttingen, and a sum of 300*l.* to Euler, for having furnished to Mayer the theorems which he used to construct his theory.*

The first volume of the "Nautical Almanac" is concerned with the year 1767, and appeared in 1766. Although infinitely superior to the "Connaissance des Temps" for 1767, this publication is far from the perfection which it has since attained. Its object is two-fold, but not well-defined; it contains much information useless to the astronomer, and many things besides which the mariner could dispense with. There is first a calendar with the aspects of the planets, then a solar table giving for each day the longitude of the sun at noon, calculated to $\frac{1}{100}$ of a second; the right ascension of the sun in time to $\frac{1}{10}$ of a second, his declination to a second, and the equation of the time; next follow the eclipses of the four first satellites of Jupiter; then tables of the planets, giving the longitude (to a second) and the latitude (to a minute), heliocentric and geocentric, the declination (to a second), the hour of the passage of the meridian (to a minute), every third day for Mercury, and every sixth day for the other planets. The table following gives, for every day from noon to midnight, the longitude (to the $\frac{1}{100}$ of a second) and the latitude (to a second) of the moon, her right ascension and declination from noon to midnight, as well as her apparent semi-diameter and horizontal parallax. Then follow the distances calculated for every three hours, of the moon from the sun and from a certain number of stars of the first magnitude, and lastly the configuration of the satellites of Jupiter for every day in the year, at 5.30 P.M. The work is completed by detailed and well-written instructions, telling the signification and use of the various tables contained in the volume.

The calculations are, moreover, made with an amount of care far greater, according to Lalande, than was ever bestowed on the "Ephemerides." Each article was calculated separately by two persons and verified by a third calculator. In the case of the longitudes, latitudes, right ascension, declination, semi-diameter, and parallax of the moon, these were calculated by one person for noon and another for midnight, and afterwards verified by the mean of the differences which were carried as far as the fourth order.

Some years later, in 1772, three English astronomers, Lyons, Parkinson, and Williams, published some exceedingly convenient tables, entitled, "Tables for correcting the apparent Distance of the Moon and a Star from the Effects of Refraction and Parallax" (Cambridge, 1772), by the aid of which ten minutes sufficed to calculate an observation of distance between the moon and a star, and therefore to deduce the longitude. The use of the lunar distances became from that time a great convenience. It was in the same year, 1772, that Lalande transferred into the "Connaissance des Temps" for 1774 the calculations of the lunar distances copied in the "Nautical Almanac," "not having," said he, "either the leisure to do it myself, nor the means which the Commission of Longitude of London furnished to the Astronomer-Royal Maskelyne, for maintaining calculators, whose work he had only to superintend and verify." The introduction of these lunar distances doubled the value of the "Connaissance des Temps," which became a work useful at once to astronomers and mariners.

IV. Foundation of the Berlin "Astronomisches Jahrbuch"

This same year, 1774, witnessed the appearance of a

* Fifty years later, another parliament authorised the printing of the new lunar tables of Hansen, his compatriot, and awarded to that illustrious astronomer a sum of 3,000*l.* by way of national recompense.

great number of publications analogous to the *Connaissance des Temps* and the *Nautical Almanac*, all intended to regulate the publication of the Ephemerides, which in nearly all countries astronomers published at different times. Of these we shall mention the "Jahrbuch" of Berlin, the "Ephemerides" of Vienna, and those of Milan.

The idea of the "Berliner Astronomisches Jahrbuch" originated with Lambert. Born August 29, 1728, at Mulhouse, then a free town of Alsace, of parents who kept a small tailor's shop, Lambert received a very incomplete elementary education, which he afterwards supplemented by assiduous labour and persevering determination. In 1748 Count Pierre de Solis entrusted Lambert with the education of his children, this was an opportunity of which he knew how to take advantage. He found in the Chateau of Core, the abode of this nobleman, an exceedingly rich library, by means of which he not only completed his imperfect education, but from which he drew the elements of one of his finest works, the "Dissertation on the remarkable Properties of Light." Shortly after, in 1763, the restraints to which Protestants were subjected in France, and in particular the law which prohibited them from exercising any public functions, induced him to yield to the invitations of Frederick the Great; Lambert went to live at Berlin, and became, in 1764, a *pensionnaire* of the Royal Academy of Prussia. France thus lost one of her scientific glories; for, not only was Lambert a distinguished astronomer, but pre-eminently remarkable for the universality and extent of his attainments.*

Long before the time to which we refer there had appeared at Berlin Astronomical Ephemerides, the first, due to the astronomer Grischow, date from 1749, it is the "Calendarium ad annum 1749 pro meridianum Borelinense cum approbatione Academicæ regni Scientiarum et elegantiarum litterarum Borussiae." They were carried on by Grischow until 1754, and suffered afterwards many interruptions. It was these Ephemerides which Lambert undertook to revive. According to the plan which he proposed to the Academy of Berlin, each volume of the "Jahrbuch" would appear two years in advance and consist of two parts. One part was devoted to the astronomical ephemerides (Prussia not then having any marine, Lambert had not to trouble himself with nautical ephemerides) and so disposed that it could easily serve for a place of different latitude; the other forming a collection of all the news concerning the astronomical sciences (observations, remarks, and problems). Lambert also proposed to collect, in another work, all the tables serving either for the calculation of the ephemerides or for other astronomical calculations.

The proposal of Lambert having been adopted, an astronomer who was afterwards director of the Berlin observatory, and whose reputation became universal, J. El. Bode, was entrusted, under the direction of Lambert and the nominal superintendence of the Academy, with the numerous calculations which the publication of these Ephemerides necessitated. The first volume appeared in 1774, under the title of "Berliner astronomisches Jahrbuch für 1776, unter Aufsicht und mit Genehmigung der königlichen Academie der Wissenschaften verfertigt und zum Drucke befördert."

Lambert had the direction of the "Jahrbuch" for only a very short time, death came soon after to deprive Science of one of her most ardent worshippers. Nevertheless his initiative, though of short duration, was successful, and from its first appearance, the work which he founded progressed more notably than those which preceded it.

At the same time also appeared the Ephemerides of Milan,—"Ephemeri astronomiche per l'anno 1775, calculate pel meridiano di Milano, del abbe Angelo de

* His most important astronomical work is entitled "Inaugures Orbites Cometarum Proprietates."

Cesaris." It was also the first volume of a series of ephemerides which have been since continued without interruption.

In 1799 the publication of the Portuguese ephemerides commenced. "Ephemerides astronomicas calculadas para o meridiano Observatorio nacional de Universidade de Coimbra, para uso do mesmo Observatorio, e para a da navegacao Portuguesa."

Lastly, in 1756, appeared the ephemerides of Vienna. "Ephemerides astronomice anni 1757, ad meridianum Vindobonensem jussu Augustorum calculis a Maximiliano Hell Casario regio astronomo et Mechanicus experimentalis professore publico et ordinis," which were continued by Tnesmecker. The Ephemerides of Vienna were constructed upon the model of the *Abbe de la Caille*, much more than upon that of the *Connaissance des Temps*. Moreover, at this period, the Ephemerides of La Caille were almost exclusively employed by French astronomers.

(To be continued)

THE BRIGHTON AQUARIUM

IN accordance with an intention entertained previous to resigning the tenure of my office as Curator to the Brighton Aquarium, I propose to give a brief outline of the plan of construction and general system of arrangements obtaining in that institution.

The Brighton Aquarium, while emulated by several buildings of a similar nature, in different parts of the kingdom and on the Continent, still holds its own in being on a scale of magnitude hitherto unsurpassed, more than one of its tanks, in illustration of this, being of sufficient size to accommodate the evolutions of porpoises and other small Cetaceæ. The architect and originator of the undertaking, Mr Edward Birch, well known as the engineer of the new pier at Hastings, entertained the idea of constructing this Aquarium as long ago as the year 1866 when visiting the one on a small scale then existing at Boulogne, Brighton was selected as a site on account of its proximity to the sea-coast and its great popularity as a place of resort. The works were commenced in the autumn of the year 1869, but owing to various interruptions the building was not formally thrown open to the public until August 1872, the ceremony taking place during the week in which the members of the British Association honoured Brighton as their place of meeting.

The area occupied by the Brighton Aquarium averages 715 feet in length by 100 feet in width, running east and west along the shore line between the sea and the Marine Parade; the principal entrance is at the west end facing the eastern angle of the Royal Albion Hotel. The building internally is divided into two corridors separated from one another by a fernery and considerable interspace. The approach to the first or Western corridor is gained through a spacious entrance-hall supplied with reading-tables, and containing between the pillars which support the roof portable receptacles of sea-water for the display of small marine specimens that would be lost to sight in the larger tanks.

The tanks for ordinary exhibition commence with No. 1 on the left side of the western corridor, and, as shown in the ground-plan, follow in consecutive order round the two corridors, the last, No. 41, immediately facing No. 1. The smallest of these tanks measures 11 feet long by 10 feet broad, and is capable of holding some 4,000 gallons of water, while the largest, No. 6, in the western corridor, and the subject of the accompanying engraving, presents a total frontage, including the two angles of 130 feet, with a greatest width of 30 feet, and contains no less than 110,000 gallons. Every gradation of size occurs between these two extremes, the depth of the water in all ranging from 5 to 6 feet. Supplementary to the foregoing, a series of half-a-dozen shallow octagonal table-tanks occupies a

portion of the interspace between the two corridors, these being especially adapted for the exhibition of animals such as starfish, anemones, and others seen to best advantage when viewed perpendicularly through the water. Flanking one side of this same interspace are several ponds fenced off for the reception of eels and other amphibious mammals and larger Reptilia, while at its further or eastern extremity artistic rock-work runs to a height of 40 feet, thickly planted with choice ferns and suitable exotic plants, and broken in its course by a picturesque waterfall and stream. Tanks 12 to 17 in the eastern corridor, in addition to the stream and basin beneath the waterfall, are set apart for the exclusive exhibition of fresh-water fish, the remaining tanks being devoted to marine species. The bulk of water thus utilised in the fresh and sea-water tanks collectively amounts to 500,000 gallons, and in addition to this several smaller store tanks in the Naturalists' Room, adjoining the eastern corridor, afford accommodation for reserve stock, or for new arrivals before their display to public view.

The style of architecture, dominant throughout the building is Italian and highly ornate, the arched roof of the corridors being groined and constructed of variegated bricks, supported on columns of Bath stone, polished serpentine marble, and Aberdeen granite, the capital of each column is elaborately carved in some appropriate marine device, while the floor in correspondence is laid out in acrostic tiles. The divisions constituting the fronts of the tanks are composed each of three sheets of plate glass, each plate having a thickness of one inch, and measuring six feet high by three feet wide, separated from one another and supported centrally by upright massive iron mullions, in the smallest tanks the front is represented by but one of these divisions, while that of the largest, No. 6, consists of as many as eleven. Among other conspicuous structural features of the aquarium demanding notice are the huge masses of rock entering into the composition of the tanks and fernery. Part of these are composed of porous tufa brought from Derbyshire, while the remaining and greater portion presents the appearance at first sight of old Red Sandstone of the Devonian epoch. This latter, however, is entirely artificial, being built up of smaller nondescript fragments, faced with cement and coloured sand, though so true to Nature have the boulders been fashioned and stratigraphically arranged, that more than one eminent geologist has been deceived by their aspect, and it is difficult in looking into the larger tanks to get rid of the impression that some of the miniature picturesque coves characteristic of the Devonshire coast have been transported bodily to Brighton.

The system adopted at the Brighton Aquarium for continually renewing the supply of oxygen necessary for the well-being of the animals agrees with that followed at Berlin, streams of compressed air being constantly forced into the tanks through vulcanite tubes carried to the bottom of the water, and each tank being fitted with a greater or less number of these tubes according to its size. Following the same principle there is no true circulation, each tank being distinctly independent and the same water remaining in it perpetually unless required to be changed on account of turbidity, an accident such as the cracking of a front glass, or for altering the arrangement of the inhabitants. In such cases the tanks are refilled from four large reservoirs situated beneath the corridors, holding in aggregate a quantity approximating but not exceeding that contained in the tanks above, and into which the water is first pumped by a six-horse power centrifugal engine direct from the sea, and thence conveyed by the same force to the tanks, through a main extending round the building.

The system above described while practical in aquaria at the seaside, where the supply of water is unlimited, does not answer inland, as exemplified in the decadence.

from a scientific point, of the one from which that at Brighton is copied, and even in the former case is associated with serious drawbacks and disadvantages, which forbid it from yielding in compensation for the outlay and labour expended the results realised by those constructed on later and more approved principles. It is impossible, for instance, to keep in health at the Brighton Aquarium the number of fish in comparison to the size of any given tank as will be found in the aquarium at the Crystal Palace or that of Hamburg, or Copenhagen, or any other constructed on the same principle, though at the same time it is essential to remark, that lately the capabilities of the Brighton tanks have not been turned to their greatest advantage, as instanced in No. 6, holding 110,000 gallons of water, which for many weeks past has been occupied by but three dogfish, a ray, and a few turtle; No. 11, with 9,000 gallons, by two mackerel, and so on. A remaining still greater source of dissatisfaction associated with the non-circulatory system, and yet one capable, perhaps, of full appreciation by those only who have held practical aquarium responsibility, arises from the difficulty, verging upon the impossibility, of maintaining the tanks uniformly bright and clear throughout the building. Some fish foul the water to a much greater extent than others, notably the Flat-fish or *Pleuronectidæ*, who in a few weeks will render a clear isolated tank too opaque for the opposite side some twenty feet distant to be discerned. The only existing remedy for such a case is to run off the water and supply fresh from the reservoirs beneath, but this water being drawn from the shore-line, the feeding pipe remaining exposed at half tide, is necessarily loaded with impurities, which re-agitated by the action of pumping involves the lapse of several more days before the tank is in a fit state for exhibition. At the suggestion of my predecessor, the late Mr. J. K. Lord, oysters and other bivalve mollusca were introduced into the tanks for the purpose of removing the organic particles which rendered the water turbid, but though these have proved of great service, the root of the evil remains undisturbed, and it is only by the application of the circulatory system, securing with it the more thorough oxygenisation of the water, that the problem is to be effectually solved.

This system, initiated by Mr. W. A. Lloyd at the Hamburg Aquarium, and now maintained under his personal superintendence at the Crystal Palace, consists in having, in the first place, a bulk of water in the reservoirs beneath exceeding by four or five times the total amount contained in the tanks above, and which, being pumped up by steam power and circulated through the building, takes up in its course by exposure to the atmosphere an amount of oxygen, permitting the preservation in health not only of a much larger number of inhabitants to each tank, but at the same time communicates to the water a degree of clearness and brilliancy unattainable by other means, and which brilliancy is increased or diminished in exact proportion to the uniformity and force of the current so maintained. One theoretical objection urged by the architect of the Brighton Aquarium against the circulatory system, is that in the event of paint or other deleterious substance falling into any one tank the water of the neighbouring tanks would suffer equally. Practically, such mishaps have no business to occur, and though in such a case, on the "siphon" mode of circulation first attempted but abandoned as impractical at Brighton, some mischief might be done, it would be impossible under that to be presently suggested as still feasible at the institution here under consideration, and until the adoption of which the Brighton Aquarium cannot be expected to fully realise the highest anticipations of its promoters, while the greater or less turbidity of its tanks must continue as hitherto a constant source of dissatisfaction to the directors, and of anxiety and mortification to the officers held responsible.

FIG. 1.—Front View of Tank No. 6 (right, long) Western Corridor, Brighton Aquarium.

THE RAPIDITY OF DETONATION

A CIRCUMSTANCE of singular interest has recently been revealed in connection with the investigations still being carried on with gun-cotton at Woolwich Arsenal. The experiments made with this powerful explosive have now extended over a period of ten years, and although many discoveries of vital interest have been made by Professor Abel and by Mr. E. O. Brown, who is aiding in the research, the results teach us, before everything, how much more we have yet to learn of the properties of pyroxilin. First of all, the violence of its explosion had to be tamed, then a compressed form of the material was devised, and after that it was shown that, like its sister-explosive, nitro-glycerine, gun cotton could be violently detonated, if ignited by a charge of fulminate. Gun-cotton, in fact, turns out to be sympathetic, for, according to the energy with which it is inflamed, so it responds in its behaviour: thus, if gently ignited by a spark, the cotton, in the form of yarn, smoulders slowly away; when set fire to by a flame, it burnt up rapidly; if in the form of a charge it was exploded in a mine or a fire-arm, it at once resented the shock and replied with corresponding energy, behaving like gunpowder under similar circumstances, while, lastly, if fired with great violence with a few grains of fulminate, it is detonated with as much force and with the same terrible effect as its instigator.

More recently, as many may have heard, our investigators have succeeded in detonating, or, in other words, exploding to the best advantage, gun-cotton when in a damp condition, and in this state the explosion is every bit as violent as when the material is dry. This grand discovery is naturally of the utmost importance, because, although many objections may be advanced as to the danger of storing and using gun-cotton when dry, the most nervous of us would scarcely hesitate to employ it stopping wet. In this latter condition the material is, strange to say, not only non-explosive, but positively non-inflammable; so much so, indeed, that it would be probably as serviceable in putting out a fire as a wet blanket or a damp towel would be. It can neither be inflamed nor exploded when wet; and further, unless one has the key to its detonation—a little fulminate of mercury—it is of no more value as an explosive than so much wet paper pulp. When placed in contact, however, with a fuse of the proper construction and a cake of dry gun-cotton, to start the action, the wet pyroxiline, as we have said before, detonates as readily as when the moisture amounts to but a fraction of a per cent. Moreover, the quantity of water in the material is really of no importance, for it has been found that for submarine mines, compressed cakes enclosed in a fishing-net and thrown overboard with a dry primer and a fulminate fuse, will explode with just as much energy as when confined in a water-tight steel case.

It is in respect to this detonation, and more particularly to the rapidity of its action, that we desire to speak at the present moment. Recent experiment has shown that the rapidity with which gun-cotton detonates is altogether unprecedented, the swiftness of the action being truly marvellous. Indeed, with the exception of light and electricity, the detonation of gun-cotton travels faster than anything else we are cognizant of. Thus, detonation will run along a line of gun-cotton cakes, placed so as to touch one another with a rapidity only inferior to that of electricity, setting fire to a charge or conveying a signal, if desired, almost instantaneously. Twenty thousand feet, or nearly three miles per second, is calculated to be its rate of travelling according to Noble's electric chronoscope. In one experiment forty-two feet of the material was fired, and records secured at every six feet, and in this case the results given were most uniform, for the velocity only varied from nineteen to twenty thousand feet per second, the ratio of transit being in no instance less than this.

To form an approximate idea of this extraordinary rapidity, it is necessary to call to mind the rates of travelling of other mediums. Light and electricity we may leave out of the question, as these are immaterial bodies. A bullet usually flies at the rate of 1,300 feet per second, although rifled barrels have been known to project a shot with a velocity of 1,400 feet. Sound is much slower in travelling, for a second of time is required in getting through some 1,100 feet. A quick match of the most delicate construction would probably be longer still in making way, and a train of gunpowder would be left far behind. So it may be safely affirmed, we think, that the detonation of gun-cotton travels more rapidly than any other known medium, with the exception, we repeat, of light and electricity.

It is curious to note that not every detonating or fulminating substance will induce the detonation of gun-cotton. It seems as if a certain number of vibrations require to be set up—a certain key-note to be struck—in order to secure the decomposition of the material. Thus it is found that fulminate of mercury detonates gun-cotton readily, while again it is also capable of being detonated by itself, so that if a line of compressed cakes is detonated at one end by a charge of fulminate of mercury, the detonation is communicated rapidly from one cake to another, until they are all consumed. Nor does the force diminish at all as it runs along the line, as might perhaps be imagined, if this were the case, the detonation set up at the beginning of a line would only run up to a certain distance, and there come to a full stop, as soon, that is, as the vibrations are insufficient to explode the gun-cotton. This, however, does not happen in actual experiment; and, on reflection, it stands to reason that if the first cake of pyroxilin is capable of firing the second one, the ninety-ninth is just as ready to detonate the hundredth. Thus the detonation can be carried along a line of any length, and the force is as powerful and violent at the end as it was at the beginning.

This property of gun-cotton may obviously be put to valuable use both in industrial and military operations. In any case where it is of importance that a series of blasting or mining charges should be fired simultaneously, their connection together by means of gun cotton would ensure such a result. True, the same effect could be obtained by means of an arrangement of insulated wires, the charges being detonated simultaneously with the aid of a battery, but such a plan is not always convenient nor practicable. For cutting down palisades, or stout wooden walls, a line of gun-cotton discs exploded in this way would be most efficacious, and a more ready plan of felling timber does not probably exist than that of placing around the stem of a tree a chain or necklace of the explosive in the form of compressed cakes, the detonation of these dividing the trunk as sharply as the keenest axe.

NOTES

WE read in the *Daily News*—"Mr. Henry Cole, C.B., presided at the annual meeting of the Hanley School of Art, on Monday evening, and after speaking of the results of the South Kensington Museum, said it was his painful duty to announce that this organisation, which had borne such great fruits, and which was so highly prized by the nation, and was so indispensable to the commercial and social progress of this country, was in jeopardy. The Government contemplated changes which were directly opposed to the further development of the Science and Art Department. It had hitherto flourished under a management which ensured individual Parliamentary responsibility, but it was now proposed to hand over South Kensington to the Trustees of the British Museum, who were already fully occupied in their own departments. The management of the British Museum was not such as to make them destroy of seeing

it extended to South Kensington, nor were fifty trustees the proper administrators of public money to the amount of hundreds of thousands a year granted to science and art. He appealed to art students throughout the country not to allow the work of the Prince Consort to be destroyed, and the means of their own instruction to be taken away or muddled with old decaying notions. He urged them to call upon their representatives in Parliament—and an election was not far off—to protect their interests and rights from unprincipled invasion, and he offered his humble services, if he could assist them, to preserve the institution which the Prince Consort founded from the hands of the ignorant spoiler. Mr. Melly, M.P., in proposing a vote of thanks to Mr. Cole, spoke in terms of praise of his efforts to spread art and science, and said it would be far more sensible to transfer the British Museum to South Kensington than to place the latter under the management of the British Museum. It was not by following antiquated notions that the work of education was to be carried on, but by adopting the free-trade principle which Mr. Cole had carried out at South Kensington. He was the Golden and Bright in the education of art and science. He had been in this matter a true free-trader, and in following the public he had served it. Mr. Cole, in responding, offered 50*l.* towards the establishment of a local museum. Surely it is monstrous that while a Royal Commission is sitting to inquire into these matters the Government should thus attempt to make the Commissioners look ridiculous by taking such a step without waiting for their report. This is another instance of the ignorant action of Government in all matters appertaining to Science.

The Challenger reached the coast of Brazil on September 15 last, after a successful but rather stormy voyage across the Atlantic. She was to have left Bahia on September 25 for the Cape of Good Hope.

MR. SCIATIER has received a letter from Dr. A. B. Meyer, announcing his return to Vienna after a most successful expedition to New Guinea. Dr. Meyer landed in Mac Cleur's inlet on the west coast, and crossed the main land to the Bay of Geelvink. He has obtained fresh specimens of nearly all the known Paradise-birds, and of one which he believes to be new to science.

The examination for Natural Science Scholarships, held in common at the same time and with the same papers for Magdalen, Merton, and Jesus Colleges, Oxford, has terminated in the following elections.—At Magdalen College, to the Demysbip, Mr. W. W. Jones, of Clifton College, to the Exhibition, Mr. F. J. Bell, of Christ's Hospital. At Merton College, to the Postmasterships, Mr. W. Carter, of Blackburn Science School, and Mr. F. J. Bell, of Christ's Hospital. At Jesus College, to the Scholarship, Mr. E. W. Poulter. It will be seen that Mr. Bell was elected by two colleges and has decided to accept the election to Magdalen. There were fourteen candidates. The election to the Biological Fellowship at Magdalen College took place on Saturday last, when Mr. C. J. F. Vule, of St John's College, Cambridge, was announced as the successful candidate. The election to the Physics Fellowship at Merton College will not take place until Oct. 30.

We regret to have to announce the death of M. Jules Pierre Verreaux, Aide-Naturaliste au Musée d'Histoire Naturelle du Jardin des Plantes. M. Verreaux was a great traveller in early life, and enriched the French National Museum by large collections from the Cape and Australia. On his return to Europe, he was for many years scientific assistant to his brother, the late Edward Verreaux, at the *Maison Verreaux* in the Place Royale at Paris, so well known to naturalists of all countries. After his brother's death, M. Verreaux accepted the office in the Jardin

des Plantes, which he held until his decease. M. Verreaux had a very complete and extensive knowledge of the class of birds, and was the author of numerous ornithological memoirs and papers. His loss will be severely felt by ornithologists who have occasion to consult the rich collection in the Jardin des Plantes, and by many friends and correspondents in this country and elsewhere.

We have also to record the death of Dr. Otto Wacheier, a German physician, resident at Bahia, who made large collections in various branches of Natural History, and was the author of an excellent memoir on the Ophiurians of that district of South America, published in the Zoological Society's "Proceedings."

Dr. Bessels, of the *Polaris* expedition, has given evidence that the death of Captain Hall was solely due to natural causes.

SIR C. B. ADRIANS, M.P., speaking at the annual meeting of Salford Reformatory yesterday, expressed his satisfaction at the undoubted diminution of crime in this country. He did not attribute the decrease to any change in our system of secondary punishments but to the gradual spread of education and enlightenment, more especially among the lower classes.

ON November 18 there will be an election at Balliol College, Oxford, to a scholarship on the foundation of Miss Hannah Brackenbury, "for the encouragement of the Study of Natural Science," worth 80*l.* a year (and tuition free) for ten years open to all such candidates as shall not have exceeded eight terms from Matriculation. At ten o'clock, a.m., papers will be set in the following subjects:—(1) Mechanical Philosophy and Physics, (2) Chemistry, (3) Physiology, but candidates will not be expected to offer themselves in more than two of these. There will also be a practical examination in one or more of the above subjects, if the examiners think it expedient. Candidates are requested to communicate their intention to the Master of Balliol by letter, on or before Monday, November 19, enclosing testimonials from their colleges or schools, and (if members of the University) certificates of their Matriculation, and stating the subjects in which they offer themselves for examination.

We have received the List of the Candidates who took Honours at the May Examination of Science Schools and Classes in connection with the Science and Art Department. We are sorry that our space does not permit us to publish the list of names, which we are glad to see is very large, it is, moreover, very gratifying to notice that in nearly every department a considerable proportion of the successful Candidates have been "self-taught."

The following science-teachers, who attended the special course of instruction in magnetism and electricity to science-teachers, in connection with the Science and Art Department, having passed first class, are registered as qualified to earn payments in magnetism and electricity.—T. N. Andrews, G. Armstrong, T. Bayley, J. Broadland, R. Brown, W. Cook, S. Cooke, J. Hamilton, H. Harris, J. Harle, D. Iow, S. G. Maunder, A. J. Rider, A. Robinson, J. Sayle, J. Simpson, C. Symons, P. H. Tracly, J. Webb, J. W. Woods. The following for the same reason are registered as qualified to earn payment in acoustics, light, and heat.—J. Alexander, T. J. Baker, S. Barbour, J. Beavis, G. R. Begley, P. Doyle, J. B. Duckett, T. Elliott, F. Isherwood, G. Jeffrey, L. M. Leader, E. Leech, E. Magennis, J. Marshall, J. Moylan, W. Patterson, E. Reynolds, L. R. Ryan, J. Schofield, G. Severs, W. J. Snowdon, W. Sturgess, C. Symons.

The name of Dr. Kaup, whose death we noted last week, was inadvertently misspelled "Kemp." Jean Jacques Kaup was Grand-ducal Inspector of the Natural History Museum of Darmstadt.

SIR SAMUEL AND LADY BAKER, it is said, have accepted an

invitation from the Geographical Society of New York to visit that city during the summer months of next year.

THE inaugural lectures in connection with the scheme of education adopted by the University of Cambridge for the town of Nottingham, were delivered on the 9th inst. in the Lecture Hall of the Mechanics' Institution of that town, and were largely attended. Mr. E. B. Burks, M.A., Fellow of Trinity, who has been appointed to conduct classes and to lecture on English Literature, gave his inaugural lecture in the afternoon to a large audience, composed principally of ladies, for whom this subject has been specially selected; and in the evening Mr. V. H. Stanton, M.A., Fellow of Trinity, who had been appointed to teach Political Economy, opened his course. On Friday week Mr. T. O. Harding, B.A., B.Sc., Fellow of Trinity, commenced his instruction in "Force and Motion," the introduction to Physical Science. The Session will continue to next April, and will be divided into two terms. For the second term, which will commence after Christmas, arrangements have been made for the study of Astronomy, Physical Geography, and English Constitutional History. Examinations will be held at the conclusion of each Term in the work done, and University Certificates will be granted to those who succeed in them.

WE learn from the *Bulletin International* of the Paris Observatory, that Lieutenant Faram and Dr. Wykander, while passing the winter of 1872-3 on the coast of Spitzbergen, made a series of spectrum observations on the Aurora, and determined seven different spectral lines, which, according to Wykander, are identical with the spectrum at the bottom of the flame of a candle or petroleum lamp.

MESSRS. ROUTLEDGE & SONS, have in the press, a "New Illustrated Natural History," by the Rev. J. G. Wood, M.A., with 500 illustrations; and "The Book of African Travel," by W. H. G. Kingston. This work is intended to give records of the journeys of all the celebrated travellers in Africa down to the present time. It will be profusely illustrated.

MESSRS. HODDER and STOUGHTON will shortly publish "Life, Wanderings, and Labours in Eastern Africa," with an account of the first successful ascent of the equatorial snow mountain Kilima Njara, and remarks on the East African slave trade, by the Rev. Chas. New, of the Livingstone Search and Relief Expedition, illustrated.

THE annual migration of the butterfly from east to west across the isthmus of Panama in August and September was, according to the *Star*, proceeding. The butterfly has golden green stripes on a black ground, and is very beautiful. It has been recognised by Mr. O. Salvin, of London and Guatemala, as the *Uranis fulgens*.

WE have received the diminutive prospectus of what is likely to be at least an ingenious and curious work; it is entitled "Chemistatany," and will contain "2,000 chemical facts, relating to inorganic chemistry, explained within 5,000 lines of oratorical verse, compiled by permission from the works of leading chemists of the day; together with the views of the author (expressed in verse) as to the advantages of a general knowledge of chemistry." If the book is readable it will certainly be a triumph of ingenuity, if not of genius, on the part of the author, Mr. J. C. Sellars, manufacturing chemist, Birkenhead, who is also publisher.

IN the *Chemical News* for Oct. 17 will be found a long list of subjects for prizes to be awarded in May 1874, by the Société Industrielle de Mulhouse.

THE first three parts are published (price 6d. each) of "British Marine Algae, being a popular account of the Seaweeds of Great Britain, their collection and preservation," by W. H.

Griffiths. It is intended as a cheap and popular rather than scientific handbook to our marine flora, and will apparently serve a very useful purpose as such. The illustrations, though on a small scale, are sufficient to recognise the more striking forms.

THE last two parts, xi. and xii., of the new edition of Griffiths and Hensley's Micrographic Dictionary, bring down the work as far as Hydra. The botanical articles have been written up to the present state of science by the Rev. M. J. Berkeley.

MR. A. ELLEY FINCH has published the lecture he delivered last March before the Sunday Lecture Society, "On the Pursuit of Truth." We think he has done well in so doing, as he shows clearly and shortly the only principles of evidence upon which permanent and satisfactory belief can be founded, showing the distinction between the evidence which satisfies the theologian, the lawyer, and the man of science. Mr. Finch has added many footnotes and appendices, which, though often irrelevant, are in most cases valuable and interesting, the appendices being mostly abstracts of passages from the works of well-known authors bearing more or less on the subject alluded to in the lecture. We wish the lecture a large circulation among the general public, whom it would tend to enlighten.

THE *Gazette de Vos* publishes some statistics with regard to education in Germany, which appear in *La Nature*. According to the latest official information, the German Empire numbers 380 gymnasiums, pro-gymnasiums, and academies (*lycees*), 156 Latin schools (in Bavaria and Wurtemberg), 270 "real-schulen," 12 high schools, technical and polytechnic. Prussia possesses besides, 26 provincial schools of arts and industry; Saxony, 5 commercial schools and 4 schools of arts, industry, and architecture; Saxe-Coburg-Gotha, 3 schools of the kind last mentioned, the City of Hamburg possesses a school of art for boys and another for girls. Bavaria has 33 schools of arts, commerce, and agriculture, Prussia, 26 agricultural schools, with 41 winter schools of rural economy. The rest of the German Empire possesses 56 other schools belonging to one or other of these categories. Prussia numbers 260 superior public schools for girls, and the rest of Germany, 54. 143 seminaries for the training of teachers are in full activity in the German Empire during the present year; primary instruction is given in 60,000 schools. All the German States have schools for deaf-mutes and for the blind, Prussia possesses 35 for the former and 14 for the latter. With regard to schools for the artistic professions, Bavaria occupies the first rank, but Wurtemberg and Prussia have latterly made great progress in this direction.

"THE Pearl of the Antilles, or, An Artist in Cuba," by Walter Goodman, is the title of a volume just published by Messrs. King & Co. Since Mr. Goodman calls himself an artist, we should have expected a few illustrations of Cuban scenery in his work, but there are none. The work makes no pretensions to be a contribution to the natural history of Cuba, but in a very entertaining manner the author gives a series of sketches of social life on the lovely island.

THE additions to the Zoological Society's collection during the past week include two Weka Rails (*Oxydromus australis*) from New Zealand, presented by the Acclimatisation Society of Otago; an Alligator (*Alligator mississippiensis*) from New Orleans, presented by Capt. M. Cowper; two Patagonian Cougars (*Conurus patagonicus*) from Chili, two Solitary Tinamous (*Tinamus solitarius*) from Brazil, received in exchange; a Macaque Monkey (*Macacus cynomolgus*) and a Bonnet Monkey (*M. radialis*) from India, presented by Mr. G. Vetch, and deposited; a Cape Petrel (*Caprimulgus capensis*), purchased from Manila, which is the first specimen of this bird obtained by the Society.

ON THE FINAL STATE OF A SYSTEM OF MOLECULES IN MOTION SUBJECT TO FORCES OF ANY KIND

LET perfectly elastic molecules of different kinds be in motion within a vessel with perfectly elastic sides, and let each kind of molecules be acted on by forces which have a potential, the form of which may be different for different kinds of molecules.

Let x, y, z be the coordinates of a molecule, M , and ξ, η, ζ the components of its velocity, and let it be required to determine the number of molecules of a given kind which, on an average, have their coordinates between x and $x + dx$, y and $y + dy$, z and $z + dz$, and also their component velocities between ξ and $\xi + d\xi$, η and $\eta + d\eta$, and ζ and $\zeta + d\zeta$. This number must depend on the coordinates and the components of velocity, and on the limits of these quantities. We may therefore write it

$$dN = f(x, y, z, \xi, \eta, \zeta) dx dy dz d\xi d\eta d\zeta \quad (1)$$

We shall begin by investigating the manner in which this quantity depends on the components of velocity, before we proceed to determine in what way it depends on the coordinates.

If we distinguish by suffixes the quantities corresponding to different kinds of molecules, the whole number of molecules of the first and second kind within a given space which have velocities within given limits may be written

$$f_1(\xi_1, \eta_1, \zeta_1) d\xi_1 d\eta_1 d\zeta_1 = n_1 \quad (2)$$

and

$$f_2(\xi_2, \eta_2, \zeta_2) d\xi_2 d\eta_2 d\zeta_2 = n_2 \quad (3)$$

The number of pairs which can be formed by taking one molecule of each kind is $n_1 n_2$.

Let a pair of molecules encounter each other, and after the encounter let their component velocities be $\xi'_1, \eta'_1, \zeta'_1$ and $\xi'_2, \eta'_2, \zeta'_2$. The nature of the encounter is completely defined when we know $\xi_1, \eta_1, \zeta_1, \xi_2, \eta_2, \zeta_2$, the velocity of the second molecule relative to the first before the encounter, and $\gamma_1, \gamma_2, \gamma_3$, the position of the centre of the second molecule relative to the first at the instant of the encounter. When these quantities are given, $\xi'_1, \eta'_1, \zeta'_1 = \eta'_2, \xi'_2, \eta'_2, \zeta'_2$, the components of the relative velocity after the encounter, are determinable.

Hence, putting a, b, γ for these relative velocities, and α, β, γ for the relative positions, we find for the number of molecules of the first kind having velocities between the limits ξ_1 and $\xi_1 + d\xi_1$, &c., which encounter molecules of the second kind having velocities between the limits ξ_2 and $\xi_2 + d\xi_2$, &c., in such a way that the relative velocities lie between a and $a + da$, &c., and the relative positions between α and $\alpha + d\alpha$, &c.

$f_1(\xi_1, \eta_1, \zeta_1) d\xi_1 d\eta_1 d\zeta_1 f_2(\xi_2, \eta_2, \zeta_2) d\xi_2 d\eta_2 d\zeta_2 da db d\gamma d\alpha d\beta d\gamma$ (4) and after the encounter the velocity of M_1 will be between the limits ξ'_1 and $\xi'_1 + d\xi'_1$, &c., and that of M_2 between the limits ξ'_2 and $\xi'_2 + d\xi'_2$, &c.

The differences of the limits of velocity are equal for both kinds of molecules, and both before and after the encounter.

When the state of motion of the system is in its permanent condition, as many pairs of molecules change their velocities from V_1, V_2 to V'_1, V'_2 as from V'_1, V'_2 to V_1, V_2 , and the circumstances of the encounter in the one case are precisely similar to those in the second. Hence, omitting for the sake of brevity the quantities $da, db, d\gamma$, and ϕ , which are of the same value in the two cases, we find—

$$f_1(\xi_1, \eta_1, \zeta_1) f_2(\xi_2, \eta_2, \zeta_2) = f_1(\xi'_1, \eta'_1, \zeta'_1) f_2(\xi'_2, \eta'_2, \zeta'_2) \quad (5)$$

writing—

$$\log f_1(\xi_1, \eta_1, \zeta_1) = F(M, V^2, l, m, n) \quad (6)$$

where l, m, n are the direction cosines of the velocity, V , of the molecule M .

Taking the logarithm of both sides of equation (5)—

$$F_1(M_1, V_1^2, l_1, m_1, n_1) + F_2(M_2, V_2^2, l_2, m_2, n_2) = F_1(M_1, V_1'^2, l_1', m_1', n_1') + F_2(M_2, V_2'^2, l_2', m_2', n_2') \quad (7)$$

The only necessary relation between the variables before and after the encounter is—

$$M_1 V_1^2 + M_2 V_2^2 = M_1 V_1'^2 + M_2 V_2'^2 \quad (8)$$

If the right-hand side of the equations (7) and (8) are constant, the left-hand sides will also be constant; and since l_1, m_1, n_1 are independent of l_2, m_2, n_2 , we must have—

$$F_1 = A M_1 V_1^2 \text{ and } F_2 = A M_2 V_2^2 \quad (9)$$

where A is a quantity independent of the components of velocity, or—

$$f_1(\xi_1, \eta_1, \zeta_1) = C_1 e^{A M_1 V_1^2} \quad (10)$$

$$f_2(\xi_2, \eta_2, \zeta_2) = C_2 e^{A M_2 V_2^2} \quad (11)$$

This result as to the distribution of the velocities of the molecules at a given place is independent of the action of finite forces on the molecules during their encounter, for such forces do not affect the velocities during the infinitely short time of the encounter.

We may therefore write equation (1)

$$dN = C e^{A M V^2} d\xi d\eta d\zeta dx dy dz \quad (12)$$

where C is a function of x, y, z which may be different for different kinds of molecules, while A is the same for every kind of molecule, though it may, for aught we know as yet, vary from one place to another.

Let us now suppose that the kind of molecules under consideration are acted on by a force whose potential is ψ . The variations of x, y, z arising from the motion of the molecules during a time δt are

$$\delta x = \xi \delta t, \delta y = \eta \delta t, \delta z = \zeta \delta t \quad (13)$$

and those of ξ, η, ζ in the same time due to the action of the force, are

$$\delta \xi = -\frac{d\psi}{dx} \delta t, \delta \eta = -\frac{d\psi}{dy} \delta t, \delta \zeta = -\frac{d\psi}{dz} \delta t \quad (14)$$

If we make

$$c = \log C \quad (15)$$

$$\log dN = d \log C + d \log f_1 f_2 dx dy dz = c + A M (\xi^2 + \eta^2 + \zeta^2) \quad (16)$$

The variation of this quantity due to the variations $\delta x, \delta y, \delta z, \delta \xi, \delta \eta, \delta \zeta$ is

$$\left\{ \begin{aligned} & \left(\xi \frac{d^2 c}{dx^2} + \eta \frac{d^2 c}{dy^2} + \zeta \frac{d^2 c}{dz^2} \right) \delta t \\ & - 2 A M \left(\xi \frac{d\psi}{dx} + \eta \frac{d\psi}{dy} + \zeta \frac{d\psi}{dz} \right) \delta t \\ & + M (\xi^2 + \eta^2 + \zeta^2) \left(\xi \frac{dA}{dx} + \eta \frac{dA}{dy} + \zeta \frac{dA}{dz} \right) \delta t \end{aligned} \right\} \quad (17)$$

Since the number of the molecules does not vary during their motion, this quantity is zero, whatever the values of ξ, η, ζ . Hence we have in virtue of the last term—

$$\frac{dA}{dx} = 0, \frac{dA}{dy} = 0, \frac{dA}{dz} = 0 \quad (18)$$

or A is constant throughout the whole region traversed by the molecules.

Next, comparing the first and second terms, we find

$$c = 2 A M (\psi + B) \quad (19)$$

We thus obtain as the complete form of dN

$$dN = e^{A M V^2} dx dy dz d\xi d\eta d\zeta \quad (20)$$

when A is an absolute constant, the same for every kind of molecule in the vessel, but B belongs to the first kind only. To determine these constants, we must integrate this quantity with respect to the six variables, and equate the result to the number of molecules of the first kind. We must then, by integrating dN to $M_1 (\xi_1^2 + \eta_1^2 + \zeta_1^2 + 2B)$ determine the whole energy of the system, and equate it to the original energy. We shall then obtain a sufficient number of equations to determine the constant A , common to all the molecules, B_1, B_2 , &c. those belonging to each kind.

The quantity A is essentially negative. Its value determines that of the mean kinetic energy of all the molecules in a given place, which is $-\frac{3}{2} \frac{1}{A}$, and therefore, according to the kinetic

theory, it also determines the temperature of the medium at that place. Hence, since A_2 in the permanent state of the system, is the same for every part of the system, it follows that the temperature is everywhere the same, whatever forces act upon the molecules.

The number of molecules of the first kind in the element $dx dy dz$,

$$\left(\frac{\pi}{A} \right)^{\frac{3}{2}} e^{A M_1 (\psi_1 + B)} dx dy dz \quad (21)$$

The effect of the force whose potential is ψ is therefore to cause the molecules of the first kind to accumulate in greater numbers in those parts of the vessel towards which the force acts, and

the distribution of each different kind of molecules in the vessel is determined by the forces which act on them in the same way as if no other molecules were present. This agrees with Dalton's doctrine of the distribution of mixed gases.

J. CLERK-MAXWELL

ORIGINAL RESEARCH AS A MEANS OF EDUCATION*

THE subject of the value of original scientific investigation may be considered from many points of view. Of these, that of the national importance of original research is the one which naturally first engages attention, and it does not take long to convince us that almost every great material advance in modern civilisation is due, not to the occurrence of haphazard or fortuitous circumstances, but to the long continued and disinterested efforts of some man of science. Nor do I need to quote many examples to show us the immediate dependence of the national well-being and progress upon scientific discoveries, thus patiently and quietly made. If it had not been for Black's researches on the latent heat of steam, James Watt's great discovery, which has revolutionised the world, would not have been made. Practical applications cannot be made until the scientific facts or principles upon which those applications rest have been discovered. In our own science I might instance hundreds of cases in which discoveries made in the pure spirit of scientific inquiry have (generally in the hands of others than the original investigators) led to results of the first importance to civilisation. Chloroform was first prepared by Liebig in 1834, but it was Simpson who long afterwards applied it to the relief of suffering humanity. Faraday in 1825 discovered benzole, and from it Zinin prepared a substance called aniline, which for many years remained a chemical curiosity only interesting to the scientific man. In due course, however, a practical sphere of usefulness was to be opened out for this little known substance. Perkin discovered that this rare body was capable of yielding splendid colours. Commercial skill then at once seized upon aniline, and, instead of its being made by the ounce, it is now manufactured by thousands of tons, and the bright and beautiful colours which it yields are known all the world over, and are alike pleasing to the eye of the connoisseur of fashion and of the dusky denizen of the forest primeval. Thus, too, the purely scientific researches of our distinguished fellow-citizen Dr Schunck, respecting the dyeing principle contained in the well-known madder root, laid the foundations for the subsequent discovery, by Graebe and Lieberman, of the artificial production of this naturally occurring principle, termed alizarine, the manufacture of which is now assuming such gigantic proportions. Again, the discovery of chlorine by Scheele, in 1774, lies at the foundation of the whole of our Lancashire trade, for without bleaching powder the cotton and paper manufacturers could not exist on their present extended scale. I might almost indefinitely extend this list of discoveries, which, when first made, were apparently far removed from any useful application, but which all at once became the starting point of a new branch of industry, and a source of benefit or gratification to mankind.

This subject of the national importance of original research is one which is gradually but surely forcing itself on public attention. A few years ago national elementary education was looked upon as a chimera, now it has become the question of the day. As soon as English people see as clearly as we do the imperious necessity for encouraging, stimulating, and upholding original research as containing the seeds of our future position as a nation, they will not be behindhand in securing the free growth of those seeds. It is therefore the bounden duty of all those whose employment or disposition has led them to feel the truth of this great principle, to leave no stone unturned to make widely known and keenly feel the importance of the national encouragement of original investigation.

It might have been a useful task for me to contrast what is done in other countries for the encouragement of free inquiry and research, and what is done, or rather left undone, in England. We should have seen that on the Continent of Europe, to a great extent, and in the United States, in some measure, those who have to wield the sceptre of government are not only aware of the national importance of original research, but, what is more, that they act up to their convictions, whilst we feel that the same cannot be said in our country. We should have

seen that in Germany the facilities given in the universities, which are Government institutions, and in the other numerous and well-organised scientific educational establishments, to original research are very great; that an original investigation in some branch of human knowledge is considered the usual termination of the student's university career; and that degrees are generally given only when some new observations or experiments have been added to the mass of human knowledge. We should find that the position of professor is mainly influenced by the amount and quality of his original researches, and that this power, and not any secondary or subsidiary ones, as is sometimes the case with us, is taken as the proof of a man's fitness to fill the professional chair.

It is my wish, however engraving this view of the subject may be, to ask you to consider to-day another aspect of the question—viz the educational value of original research, the value of personal communication with nature for its own sake, the influence which such employment exerts on the mind, the effect which such studies produce as fitting men for the active duties of life, and the question, therefore, as to how far original investigations should be encouraged as an instrument of intellectual progress. It may be well, however, before we commence this special question, to place clearly before our minds what is meant by scientific inquiry in general, and to see how it is related to the studies and habits of mind with which men up to the dawn of the present, or scientific age, have been familiar.

In the first place, then, the essence of the scientific spirit is that it is free and disinterested. If, therefore, any of the habits of mind, studies, or beliefs in which men have hitherto indulged have not been free nor disinterested, in so far they have not been scientific. In the second place, the spirit of true scientific inquiry knows nothing of tradition or authority. It lays down laws for itself, and refuses to be bound by any others. Scientific education begins with no preconceived ideas in accordance with which everything else must be moulded. It starts in simple communion with Nature, and is content to pick up little by little the truth which she is always ready to communicate to patient listeners. Thus step by step and generation by generation, slowly but surely, the perfect edifice of science is being built up, and all those who contribute, however insignificantly, to this great work have the safe assurance that their labour has not been in vain. This process is, it is clear, at once opposed to, and, if successfully carried out, subversive of the old order of things. Between a system based on authority and one founded on freedom of thought and opinion there can never be any united action, and whilst fully acknowledging that intellectual eminence, and, of course, moral excellence are common to all classes of men, and are not confined to those holding particular opinions, if only they be honest, it is as well that we should admit with equal candour that the followers of the old system have no claim to be called scientific, and that there is, from the nature of things, a great and impassable gulf between us and them.

It does not concern us at present to inquire which of these two systems, the free or the authoritative, is for the future to rule the world. It must now suffice for us to see clearly that the habits of mind necessary for the establishment of the one are absolutely opposed to those needed for the success of the other.

I must, however, here not be misunderstood. It would ill become me, connected as I am with a college to which it has been our constant aim to impart a university character, to undervalue or depreciate the study of subjects other than those included under the head of the physical sciences. Literary studies, whether of modern or ancient authors, giving an acquaintance with the noblest thoughts and opinions of the great men of past ages; historical studies, giving us a knowledge of the acts of men in times gone by, the study of language and philology, as giving a knowledge of how men of all times and countries express their ideas and language, of logic, as pointing out the laws of thought, and above all, that of mathematics, are all matters of the highest importance, the neglect of which would render our education poor and incomplete indeed. The same rules, however, which all acknowledge to be necessary for the teaching of physical science must be applied to the study of all these subjects. In short, the scientific method must be employed in all cases and carried out to its fullest extent. Whilst attempts to shackle the mind, or to stifle free inquiry, which have too frequently succeeded in past times, and which may, if we are not on our guard, succeed again, must be repulsed with all our vigour.

* Address by Prof Roscoe at the opening of the new buildings of the Owens College, Manchester.

I would, however, here wish to protest against the supposed materialistic tendency of scientific studies. It is true that certain opinions and professions of belief have been and will be shaken by studying the book of nature; it is also equally true that the study of nature does not and cannot interfere with the highest and noblest aspirations of the mind of man. In the investigations of every branch of science we come at last to a point at which further inquiry becomes impossible, and we are obliged to acknowledge our powerlessness and insignificance. We can see and learn concerning only the minutest fraction of the great whole of nature, and it is with this minute fraction alone that we as men of science are concerned.

In inaugurating, as we are now doing, a scientific department of an institution devoted to the higher education, it may be well to glance for a moment at the preliminary stages through which, in the subject of chemical science, with which alone I am competent to deal, a student must pass to reach the portal of original inquiry. And first let me gratefully acknowledge the help which we have received in endeavouring to find a habitation for a school of chemistry aspiring to be worthy of the intellectual vigour and manufacturing power of the great district of which this city is the centre—help not only of the necessary, and therefore valuable kind of pecuniary assistance generously and willingly given, but help of a personal, and therefore still more valuable kind, without which the funds would have been useless, and our scheme for the foundation of a really great scientific institution would have fallen to the ground. The results of this help you now see in this large theatre, and in the splendidly fitted laboratories behind it. They are, I say it with confidence, the most spacious and best arranged laboratories in Great Britain, and will be found, I believe, second to none in the world for convenience and suitability to their proposed uses. It now remains for my colleagues and myself to discharge our debt, to show that the confidence which has been placed in us has not been misplaced, and to prove year by year that the goods we furnish in the shape of soundly and scientifically educated chemists bring a return worthy of the capital, both in specie and intellect, which has been expended upon their production.

Our mode of instruction in the principles of chemistry is of two distinct kinds. (1), by lectures, accompanied by experimental illustration by the lecturers, as well as by recapitulation and tutorial classes; and (2), by experimental work, practically carried out by the student himself in the laboratory. Both of these means of obtaining command over the facts and principles of our science should be carried on simultaneously, the lectures serve as giving a general view of the main features of the subject; the laboratory work brings the student into direct contact with Nature, and gives him an insight into her processes, which can only thus be obtained. In the lecture room the student forms an idea, as in a panorama, of the general appearance of the country, but it is in the laboratory, as in a walk through a given district, that he first learns what the land he is travelling through is really like. And although we know that we must spend much time and labour if we go on foot, we know that we shall be rewarded by a vivid and lasting impression, and one which may perhaps give a new colour to our lives. It is thus with the study of chemistry, the laboratory is the place where the details of the science are really mastered, and a young man must not expect to become a competent chemist without having passed several years of hard and unremitting toil in solving the sometimes tedious and difficult problems which are presented to him.

It is not necessary for me here to detail to you the particulars of the course of instruction which all students of chemistry, as a rule, go through. Suffice it to say that this course begins at the very A B C of our subject, and, if I am freely to speak my mind, I would say that in general I do not object to take students who know nothing of the science. We first seek to give him some notion of the kind of phenomena with which the science is concerned, we then begin to train him in manipulative dexterity, and, by a graduated series of examples and exercises, make him acquainted with the fixed and exact quantitative laws upon which our science is founded. From the beginning we introduce a strict system of note-taking and of carrying out simple chemical calculations, so as to insure a firm foundation for the subsequent building. The student then begins to learn the properties of the more commonly occurring amongst the sixty-three elementary bodies of which (as far as we are yet aware)

the material world is built up, and properties of their compounds. He commences the study of qualitative analysis, and at last he is able to tell you the nature of the exact constituents of any substance, whether of earth, of air, or of sea, of mineral, vegetable, or animal nature, which you may ask him to examine. He has accomplished a great work, and if he has carried his examinations as far as the reactions of the rare elements (as is usually the case with all our students), he is master of the first or qualitative stage of the science. Next the question arises as to the quantity of each constituent present in the given substance, and the second or quantitative stage is reached. This is necessarily a longer and more difficult matter than his preceding task. Not only must the choice of methods of separation and estimation be successful, so as to employ good ones and eschew the bad or inaccurate ones, but skill in manipulation must be forthcoming. All depends on accuracy and care in performing delicate operations, such as weighing, collecting and washing precipitates, and a hundred other manipulations, and the results of many days' work may be in a moment lost by one false step or one careless action.

In all this preliminary work the hand is gradually trained to perform the various mechanical operations, the eye is at the same time taught to observe with care, and the mind to draw the logical inferences from the observed phenomena. Habits of independent thought and ideas of free inquiry are thus at once inculcated, no authority besides that of the senses is appealed to, and no preconceived notions have to be obeyed, the student creates for himself his own material for observation, and draws his own conclusion therefrom. If he is inaccurate either in his manipulation, his observations, or in his conclusion, nature soon finds him out. Something or other is out of order, and he is sent back with the task of finding out his mistake for himself. Not until all this has been accomplished (and very often not then) is the student fit to think about original research. Before he can successfully grapple with new difficulties he must have learned to overcome the old ones. His hand must be dexterous and accustomed to meet all the mechanical difficulties which invariably accompany such investigations, his eye must not only be open to what he expects to see, but, what is far more difficult, it must quickly seize upon the occurrence of phenomena which he does not expect to see; his mind, working, perhaps, with a leading thought—for without this, original work is almost impossible—must be free in its power to grasp any new combination of ideas to which the phenomena may suddenly and unexpectedly give rise, and be willing at once to relinquish a favourite and cherished hypothesis if the results of experiment prove that hypothesis to be erroneous. This dexterity of hand, quickness and keenness of sight, and pliability of mind must in greater or lesser degree be possessed by all who would undertake original scientific work. I do not mention as a preliminary necessity a competent theoretical knowledge of the phenomena and laws of our science, because, though this is a matter of course, many having this knowledge will altogether fail, owing to their not possessing the other requisites.

In carrying out, then, even the simplest original investigations, some or all of these requirements are needed. In addition, other faculties are called into play by the very fact of the phenomena being in part at least new. Not only do we ourselves not know what to expect, but nobody can tell us what will happen. We are exploring new country, and our outlook must therefore be doubly sharp, we must be prepared for every possible event, and ready to meet every change of fortune. We must, like a traveller, not be discouraged by reverses, but patiently persevere in our course, feeling convinced that the path, which for a long time may be a thorny one, must in due course lead us to a point from which we shall enjoy an extended view of the surrounding country, and be able to trace the tortuous paths by which the elevation was reached. The faculties which are called into active operation in the prosecution of experimental scientific research are, in fact, exactly those which are valuable in the every-day occurrences of life, the proper employment of which leads to success in whatever channel they may happen to be directed. A man who has learnt how successfully to meet the difficulties and overcome the obstacles which occur in every experimental investigation, is able to grapple with difficulties and obstacles of a similar character with which he comes in contact in after-life.

(To be continued.)

CONDUCTING POWER FOR HEAT OF CERTAIN ROCKS*

A collection of more than twenty specimens of rocks of the best marked descriptions were chosen for the purpose, and were cut to a uniform shape and size by Messrs. Walker, Emley, and Beall, of Newcastle on Tyne, and a part of them were subjected to experiment. The plates are circular, 5 in. in diameter, and half-an-inch thick, and they are as smoothly and accurately ground to this uniform size as was possible in the case of some of the refractory substances as granite, whinstone, &c., that were employed. On the other hand, many more friable and softer rocks, as chalk, coal, sand, &c., are not included in the list of sample sections now collected.

The purpose of the present paper is simply to establish from the experiments the general *bad* conducting powers of the harder rocks, and to corroborate in the case of a few examples, that were numerically reduced the conclusions of a similar kind that were obtained by Peclet.

The rock-plate to be tested is placed on a flat-topped tin boiler of its own diameter to raise its temperature on the underside to the boiling-point of water, while on its upper side a conical flat-bottomed tin flask of spring-cold water is placed, and absorbs the heat transmitted through the rock section from its heated side. A thermometer inserted through a cork in this flask marks the rise of temperature and the quantity of heat transmitted through the rock.

A small quantity of heat is also intercepted and absorbed by it which requires a part of the higher temperature on the heated side to introduce it into the rock, but this quantity is so small compared to the quantity which passes through it and enters the water, that it may easily be allowed for by a suitable correction.

The flask above the rock contained about $\frac{1}{4}$ lb. of water, and under the action of the steam heat below, it rose in temperature about 1° in 35 seconds for slate, and 1° F in 38 or 40 seconds for different kinds of hard and close-grained rocks, as granite, serpentine, marble, and sandstone, while the time occupied for a similar rise in temperature was greatest in the case of a specimen of black shale from the coal measures round Newcastle, when the thermometer rose 1° in 48 or 50 seconds, or *about* than in the case of slate in the proportion of about 5 : 8.

In this series of trials it was easily supposed that the real temperature of the surfaces of the rock-plates was considerably different from those of the metallic surfaces in contact with them, and a thermo-electric pair of wires attached to cork-faces was now applied to test the real difference of temperatures of the two faces of the rocks. Two platinum wires were twisted on to the two ends of a piece of iron wire and were connected with the poles of a Thomson's reflective galvanometer. The iron wire itself was bent so as to bring its two twisted ends into contact with the opposite faces of the rock. On testing the thermo-electric arrangement by means of a double tin lid placed between its cork-faces, filled with water of different degrees of temperature on its two sides (which were measured by thermometers inserted in the lids), it was found that a difference of between 3° and 4° F produced a deflection of 1 division of the galvanometer.

On now taking a plate of marble out of the heating vessel and placing it between the thermopiles, it was found that no sensible heat difference was recorded by it, the rock was reversed, top for bottom between its poles, and the effect was still insensible, although the heat of the finger pressing alone on one of the wire junctions moved the galvanometer 3° or 4° . In order to increase the temperature difference the rock-plate was then brought into contact with the metal surfaces by means of mercury, and the thermometric flask itself being filled with about 10 lbs. of mercury instead of $\frac{1}{4}$ lb. of water, it was found that the thermometer rose 1° in 10 seconds, corresponding to a transmission of 330 heat units per hour through a standard plate 1 in. thick, and 1 square foot in surface. When taken out of its cell and transferred to the galvanometer, the temperature difference was now found to be about 7° ; giving the rate of conduction about 47 heat units per hour, instead of between 22 and 28 heat units as assigned by Peclet.

The process of lifting the rock out of its cell having undoubtedly produced a loss of the heat difference before the measurement was made; a new mode was now employed, and the

wire junctions were pressed against the rock faces *in situ*, being at the same time protected from the heat of the boiler and thermometer plates facing opposite to them by thick felt wads upon which they were fastened to those plates. In this case a very different variation between the two rock-faces was now found the difference in the case of marble being 50° or thereabouts, while the passage of heat into the water thermometer flask was now about 264 heat units per hour, corresponding to a conducting power of about 61 heat units per hour. The same process was applied to two kinds of the black shale already described, and their conducting power was found to be much less than that of the fine-grained marble specimen, being at the rate of only 2 or 21 heat units per hour. These quantities are not more than $\frac{1}{10}$ or $\frac{1}{10}$ part of the values obtained by Peclet for the same kinds of rocks. Although time did not permit these experiments to be repeated with a different arrangement of the apparatus, when the sources of error peculiar to each of them would have been easily removed, as their origin in each case is easily explained, yet they confirm provisionally the values of the thermal conductivities found by Peclet, since, in two experiments which certainly gave the values alternately in excess and defect, the quantities obtained varied from 5 or 7 to 42 or 47 heat units per hour for a kind of marble to which Peclet assigns 22 or 28 heat units per hour as its conducting power, and in the case of some other rocks of which Peclet describes the conductivity as about half that of the close-grained marble just mentioned, the values found by experiment also indicate a smaller thermal conductivity of these rocks in almost exactly the proportion which Peclet has assigned.

The form in which it will be desirable to repeat these experiments is one which will show the amount and kind of influence exercised by junctions between the surfaces of solid, liquid, and gaseous bodies in retarding the transmission of heat across them, as well as to conclude the actual thermal conductivities of the materials employed, and for this purpose, a suitable modification of the apparatus and of the mode of conducting the experiments has been contrived, which it may be expected will fully effect the objects which it is thus intended to obtain.

THE DIVERTICULUM OF THE SMALL INTESTINE CONSIDERED AS A RUDIMENTARY STRUCTURE*

THE author took this structure as an illustration in reply to those who are not yet satisfied that structures, even which are useless in the animal body cut among them. Referring first to the case of the appendix vermiformis of the great intestine, a survey of the anatomy of the *cæcum* in various animals, and of the stages of its development in man, leads to the inference that this worm-like appendage is a rudimentary and virtually a useless structure. It has, however, been generally supposed that, being present, it must have some function; and as it was manifest that a thing of this kind at the otherwise closed end of the great intestine is a source of danger by admitting foreign bodies which it could not expel, it has been argued that contrivances designed to avert this danger might be recognised. That it opens at the back instead of at the bottom of the *cæcum*, that its opening is oblique, that it has a kind of valve, that it is directed more or less upwards, and so on. On the contrary, the worm-like appendix is a tube, the rudimentary representative of the true *cæcum*, and all the supposed contrivances by which the danger is lessened are simply the result of the forward and downward development of the great intestine away from the resting wall of the abdominal cavity against which the appendix and back of the intestine lie. Although from this cause the appendix vermiformis is not nearly so dangerous a structure as it might have been, it is, notwithstanding, occasionally the cause of death. The author knew of several cases of this, and every experienced pathologist must have met with it. Foreign matters get impacted, causing ulceration, and perforation takes place, followed after a few hours by death.

The conclusion, however, that there are parts within the animal body which are useless, and worse than useless because dangerous, is so distasteful to the adherents of the extreme theological school that they will rather fall back on the bare possibility of some unknown function even for a rudiment. The diverticulum of the small intestine may be employed here to complete the argument. Although in a classification of rudimentary

* Paper read by A. S. Herschel, F.R.S., before the British Association, Bradford.

* Abstract of a paper read by Prof. Struthers, F.R.S.E., of Aberdeen, before the British Association, Bradford.

structures they would be placed in different groups, the one being normal though often varying, the other only occasional, they are on the same footing for the purposes of this argument. It is known to be a vestige of the structure joining the intestine which, at an early stage of the evolution of the animal frame, nourishment is introduced. All trace of it usually disappears, but occasionally part of it remains as a pouch opening from the small intestine. It has the usual coats of intestine, the inner coat presenting the same food-absorbing villi. It is therefore acting, but no one will argue that it is designed for use in those comparatively few persons who possess it. Unfortunately it is sometimes the cause of death. The author had met with cases of this, and it is well known to surgeons. It may be unable to expel its contents, or by adhering to a neighbouring part a noose is formed, a most dangerous condition, a sort of bowel-trap, through which a knuckle of intestine slips, and strangulation, followed by death, is the result. Here then we have an elaborate structure which is useless, or worse because dangerous. Were a railway contractor to leave open a siding which he had used in the construction of the line, the train might dash into it and a fatal accident result. This is exactly what is done when this diverticulum of the small intestine is left unclosed, and the fatal accident occasionally occurs. Were further illustration necessary we might refer to the fact of discase sometimes attacking that functionless structure the rudimentary breast in the male.

The consideration of such structures as the diverticulum may be said not to take us farther than to clear the ground, showing us that we have been on the wrong path. But a survey of rudimentary structures generally carries us farther. On the hypothesis of the independent origin of species they are unintelligible, while the hypothesis of evolution furnishes a clue to the whole. The facts of embryology, of palæontology, of rudimentary as well as developed structures are harmonised, and the whole present themselves as the result of the operation of a great law, the equivalent in the organic world of the law of gravitation in the inorganic. Although we do not as yet see so well how this biological law operates, the anatomist sees enough to make him feel that he is shut up to some form or other of the theory of evolution, and that the notion which we imbibed in our early years, and have long cherished, that so-called species arise independently of each other, must be a mistake.

The slow progress which this view has made in this country compared with Germany, the author attributed partly to the theological bias which anatomy early received among us, but mainly to the fact that anatomy has been taught in the medical schools of this country for the most part as a mass of detail in its professional application, without reference to the ideas which it suggests when more widely and profoundly studied as a science.

SCIENTIFIC SERIALS

Ocean Highways, October.—The principal article in this month's number is one by Lieut. Salaverry, of the Peruvian Navy, on the "Navigation of the Upper Amazon and its Peruvian Tributaries," in which he gives some very interesting particulars of the measures that have been adopted by the Peruvian Government to open up and encourage the flow of commerce along the great fluvial highways which connect the rich provinces of the Andes with the Atlantic. The amount of work done by the Peruvian Government during the last few years in the exploration of the region with which the article is concerned is wonderful, and we are sure quite unknown even to many of those who take an interest in geographical discovery. Captain Davis contributes a second article on the *Challenger*, which is followed by one on the Pacific Railways of the South, *i.e.* the Southern United States. Two very interesting narratives are "A Visit to the Kuli-I Khwaysh in Sistan," the place mentioned being remarkable hill to the west of Nasrabad, the chief city of Sistan; and "A Visit to Kulaja," by Mr. Ashton Wentworth Dilke, the plain of Kulaja being "a continuation of the Seven Rivers country running up between the Ala Tau and Than-Shan Mountains."—A. E. G. Ravenstein contributes a paper on "Elmina, and the Dutch Gold Coast," which is followed by an article on the *Philæa*, the usual reverse proceedings of societies, &c. There are Maps of the former Dutch Possessions on the Gold Coast, of the Amazonas in Peru, of the

Pacific Railways of the South, and a Chart of the *Challenger's* course to the Cape de Verde Islands.

Bulletin de la Société Impériale des Naturalistes de Moscou, No. 3, 1872.—In a paper on tautalum, in this number, M. Herman describes five different combinations of the metal with oxygen, two only having been hitherto known.—There are several zoological and botanical lists.—M. Becker gives an account of beetles and flies met with on a journey to the Astrachan region. Mr. M. A. Chasovnikov gives drawings of some new species of *Thryxus*, and 1 *Chrysopa*, found in Finland and the Caucasus; M. Hochhuth enumerates the beetles of Kien and Volynien, &c., while M. Lindemann furnishes a report on the formation of his herbarium.

—M. Lubimoff's paper on a new theory of the field of vision and magnification of optical instruments, has been elsewhere noticed in our columns.

No. 4 (1872) commences with an interesting article, with illustrations, by M. Mayewski, on evolution of the barbules of *Reynolds mamata*, showing the various stages from that of simple hairs consisting only of epidermic cells.—Some structures on M. Lubimoff's views as to the field of vision are offered by M. Reichlin, who thinks the theory neither new nor exact.—M. Hochhuth continues his list of beetles (as also in the following number), and M. Kryloff describes some geological formations in the Government of Kostroma.—Dr. Drescher communicates an account of a collection of mathematical and physical apparatus in Dresden, and the number concludes with a table of meteorological observation in Moscow, in 1872.

SOCIETIES AND ACADEMIES

LONDON

Royal Horticultural Society, Sept. 17.—General Meeting.—Mr. Henry Little in the chair.—The Rev. M. J. Berkeley called attention to some pears, part of which were cracked and small, while the rest were perfect. They had been taken from opposite sides of the same tree, and the difference was probably caused by injury from wind when in a young state.—Mr. Bull exhibited for the first time *Odontoglossum Roehrii*, a near ally of *O. scutellarium*, and which Prof. Reichenbach suggests may be a hybrid between that species and *O. Phloxopsis*.

Oct. 1.—General Meeting.—Mr. Henry Little in the chair.—The Rev. M. J. Berkeley alluded to the numerous interesting and rare species of fungi which were exhibited. *Favulites atramentaria*, sent by the Rev. W. W. Newbould from Woburn, *Russula anata*, by Mrs. Hubbard, from Horsham, *Hidnum squameum*, new to Britain, from Somerset, by Mr. Aubrey Clark, *Corticiarius orcellanus*, also new to Britain, from Ljssing Forest, by W. G. Smith, &c. Mr. Berkeley also referred to Schwendener's theory as to the nature of lichens. Bornet had recently published an admirable paper in support of the same views. He himself, however, was not convinced of their correctness. On the contrary he believed he had seen the gonidia of *Peridermium* originating from hyphae within the cells of some drift wood from the Arctic regions. He also read a letter from Dr. Thwaites, of Ceylon, who thought that the symmetrical growth of the lichens was an argument against one portion being parasitic on the other.

PHILADELPHIA

Academy of Natural Sciences, June 10.—Dr. Ruschenberger, president, in the chair.—Mr. Gentry made the following remarks.—At the last meeting of the Academy, Mr. Meahan made some observations upon the peculiar structure of the flowers of *Pedicularis canadensis*, observing that he had vainly watched them during two seasons with the view of determining the manner in which they were fertilised. He further said that he had noticed that they received the attention of a species of humble-bee, for the sake of their honey, which, in order to accomplish its purpose, always bored a hole into the side of the tube. On Wednesday morning last, I visited a spot where the plants were growing luxuriantly, affording an interesting field for observation. It was not long before I observed a *Bombus terrestris* to alight upon the outer side of the tube of a flower, at a distance of three feet from me. At this distance it did seem as if he were in order to obtain the honey which it secretes, produced a slit into the tube, as Mr. Meahan observed. But the movements of the bee being so quick, and the distance too great to judge accurately, I ap-

proached the insect by degrees, until I was within three inches of it, when the whole process became apparent. The bee, however, was so intent upon its labours, as not to take any notice of me. The flower is composed of an erect tube, with a natural cleft running along its lateral walls from above, through one-third its entire length, presenting outwardly apparently a mere crease, from the manner in which the compressed margins of the upper lip fit into the rolled-in edges of the lateral lobes of the under lip. The upper lip is compressed, arched, and beaked, presenting an aperture at the apex, through which passes a curved pistil, the lower lip is reflexed, consisting of three lobes, one median and two lateral, assuming a platform arrangement. Enclosed within the upper lip are four stamens, didynamous, with their anthers turning backwards, facing each other vertically. When ripe these anthers split upon the inner side, thus giving a fancied resemblance to an oval snuff-box thrown backwards upon its hinges. Each cell is filled with white pollen grains. Now when the bee alights upon the tube, by means of its trunk, it opens the natural cleft above alluded to, and having thus gained partial entrance, it would defeat its intention did not the length of the flower's tube when contrasted with that of the bee's trunk, necessitate the admission of the entire head also. In this operation the lips of the flower are pressed apart, the margins of the upper lip are separated to receive the head, and the pollen grains, already ripe, by the considerable motion to which they are subjected, become dislodged from their cells, and fall down in a dense shower upon the bee's back and head. Having obtained the coveted sweet, it flies to another flower upon a different stalk, as I observed in scores of cases during two days, but before renewing the preceding operations, stations itself awhile upon the lower lip, its head coming in contact with the stigma of the pistil. Then, by means of the hairs that line the inner side of the tarsus of each interior leg, and the constant rubbing together of the parts comprising its trophi or its instrumenta cibaria the attached pollen grains are sent flying in every direction, sure to adhere to the stigma. Whilst observing the above process, I also noticed that after the lips had been pressed apart, and were permitted to regain their position, the upper lip, being somewhat elastic, sprang back to its place with considerable force, sending through the aperture, through which passes the pistil, a complete cloud of pollen, enveloping the stigma upon every side. This operation can be performed artificially, by taking hold of the under lip with the left thumb and fore-finger, and pulling the upper lip backward, by the right, and then releasing the hold of the latter, the upper lip springs to its place, spurring the pollen through the aperture upon the left hand. From the above it is to be seen, that the plant has two chances of being fertilised—one by its own pollen, and the other by that of another. Although the flower seeds abundantly, yet I am disposed to think that it is mainly through the pollen of another that the seeds become perfect. I incline to this opinion because, in an examination of many pods, I noticed that a few seeds were found in a rudimentary condition, apparently manifesting a tendency to abort, while the majority were in a vigorous condition; the former, doubtless, being the effects of self-fertilisation in part, which, as is well-known, is a degenerating process. I desire also to call attention to an interesting discovery which I was enabled to make recently, whilst engaged in an examination of a double flower of *Ranunculus fasciculatus*. In the genus *Ranunculus*, the corolla of a normal flower is made up of five petals, each of which on the inner side of its basal part is usually provided with a scale. This scale from its position is denominated the *nectariferous scale*. In the specimen under consideration three of these scales had assumed the character of petals, agreeing with the flower's true petals in every particular except size, being but three-fourths the dimension of the latter. It very frequently happens that we find, in examining flowers, parts which we can refer to no organ with which we have become acquainted. They appear to be distinct from any of the whorls which make up a perfect flower, although located among them and attached perhaps to them. All such parts are designated as appendages. Under this category are placed the scales that are characteristic of some species of Crowfoot. Prof. Lindley thinks that these small appendages are barren stamens united to the bases of the petals. This opinion I think is a just one. From the facts here indicated it is reasonable to conclude, that the double flowers of the *Ranunculus* do not always originate by true staminal metamorphosis, but sometimes by scale transformation; also that nectariferous

scales when they exist are barren stamens, which favourable conditions may develop into true petals. Whilst examining several specimens of *Potentilla canadensis* lately, I was struck with the variableness displayed in the number of segments which constituted their outer or calycine whorls. This series in *Potentilla*, as is well known, consists of five sepals, with as many intermediate bractlets. In the specimens to which I refer, I counted from seven to ten bractlets. This numerical variation I am confident results from the splitting, so to speak, of some or all of the primary bractlets, as specimens were observed which exhibited all the transitional forms, from a slight indentation at the apex to partial and complete division.

PARIS

Academy of Sciences, Oct. 13.—M. de Quatrefages, president, in the chair.—The president announced the death of M. Antoine Passy.—The following papers were read:—On crystalline dissociation, by MM Favre and Valsion. This portion of the author's researches deals with the estimation of the work done in saline solutions. Tables of the value of this work were given.—Researches on the ancient fauna of the Island of Rodriguez, by M. Alph. Milne Edwards.—Verification of Huyghens's law by means of the prismatic method, by M. Abria.—Monograph on the fishes of the family of the *Symbranchidae*, by M. C. Daresse.—On a mechanical purifier for illuminating gas which will also serve to mix vapour with the gas, by M. D. Colladon.—Researches on the action of the so-called antiseptics on carbanular virus, by M. C. Davaine. The author found the bodies in question were, as a rule, effective in destroying the virus.—Studies on the *Phylloxera*, continuation by M. Max Cornu.—On the oak *Phylloxera*, by M. Balbiani.—Note on a new method of tempering steel, by M. H. Caron. The method consists in quenching the heated steel in heated water, the temperature varying with the size of the article. The author stated that this method augmented the elasticity considerably without altering the softness of the metal.—On the use of potassic disulphate as a means of detecting galena, by M. Jannettaz. Meteorological observations made in a balloon, by M. G. Tassauder.—New remarks on the epidemic goitre of the St. Etienne barracks, by M. Bergeret.

THURSDAY, OCTOBER 30, 1873

OUR NATIONAL MUSEUMS

WE may congratulate ourselves that the Museum question is now being taken up with vigour. Not only must the Royal Commission on Science include it among their inquiries, but the Society of Arts is directing public attention to it.

This is the more opportune, as the intention of the Government to transfer to irresponsible trustees the only museums under the direction of a Minister of State has recently been declared, and needs only to be declared to be condemned on all hands.

We now let the following documents speak for themselves. Next week we shall return to the subject —

I

Memoir to the Right Honourable W. E. Gladstone, M.P.

"1. We, the undersigned members of the Council and Members of the Society for the Encouragement of Arts, Manufactures, and Commerce, request the attention of Her Majesty's Government to the remarkable proof of the public desire for instruction and pure enjoyment afforded by the examination of works of Art and Science, which has been shown by the opening of the Bethnal Green Museum.

"2. This Museum, established in one of the poorest and busiest districts in London, where men, women, and children are most laboriously employed, has been frequented during three months by more than 700,000 visitors,* a number which probably exceeds that of the visitors to all the other metropolitan museums and galleries during the same period.

"3. The undersigned submit that this museum could never have come into useful existence, and have been instrumental in conferring great benefits on the people, without the aid of Parliament, and they desire to press this fact upon the consideration of Her Majesty's Government, with the hope that they will submit to Parliament the policy so essentially national of voting increased means to facilitate the establishment of museums, libraries, and galleries of Science and Art in large centres of population, wherever such localities are willing to bear their share in the cost."

Appended to these are the signatures of 250 Peers, Members of Parliament, and other well-known and distinguished men.

II.

CORRESPONDENCE RELATING TO THE ABOVE MEMORIAL.

"*The Secretary of the Society of Arts to the Right Hon. W. E. Gladstone, M.P.*"

"July 3, 1873.

"SIR,—A memorial relative to the beneficial action of the Bethnal Green Museum, has been prepared by the Society of Arts for presentation to you.

"It has been signed by one hundred and fifty members of the Council and of the Society, of whom twenty-two are peers, and sixty-three are members of the House of Commons. In addition to the above, thirty-seven peers and sixty-three members of the House of Commons, not members of the Society, have expressed their concurrence in the object of the memorial.

"I am directed to request that you will have the kindness to receive a deputation to present the memorial, and to name a day for doing so, giving, if possible, at least a week's notice."

* The numbers up to the end of September were upwards of one million and a half of people. In 1841, December, 1873, only six months and a half, they amounted to 201,000, whilst the number of the general visitors to the British Museum for the whole year 1872 were only 441,000.—October 1873

"*Mr. Gurdon to the Secretary of the Society of Arts.*"

"July 5, 1873.

"SIR—Mr Gladstone desires me to acknowledge the receipt of your letter of the 3rd inst., requesting him to receive a deputation to present the memorial from the Society of Arts, on the subject of the museum at Bethnal Green. I am directed to express Mr Gladstone's sincere regret that the pressure of his duties, as First Lord of the Treasury, renders it absolutely necessary that he should confine his attention to those matters which fall directly within his province, and he therefore trusts that those on whose behalf you have written will kindly excuse him if he asks them to address themselves to the Privy Council Office."

"*The Secretary of the Society of Arts to Mr. Gurdon.*"

"SIR,—I have brought before the Council your letter of the 5th July, in reply to mine of the 3rd July, asking Mr Gladstone to receive a deputation to present a memorial from this Society on the subject of the Bethnal Green Museum. The Council observe that you express Mr Gladstone's regret that the pressure of his duties as First Lord of the Treasury renders it absolutely necessary that he should confine his attention to those matters which fall directly under his province, and his trust that those on whose behalf the reception of a deputation was sought will kindly excuse him if he asks them to address themselves to the Privy Council Office.

I am directed, in reply, to point out that the memorial, having relation to a subject of vast importance to the education, general cultivation, and social welfare of the people, did appeal to the Council to bring the subject strictly within the consideration of the Prime Minister, rather than of a department of the Government. Moreover, it did appear to the Council that the deep interest which the subject excites is manifested by the unusual character of the signatures, being those of 60 peers and 130 members of the House of Commons attached to the memorial, and justified the Council in asking for the special attention of Mr Gladstone himself.

"Under these circumstances, the Council submit their conviction that the subject involves considerations of principle and policy worthy the attention of the Prime Minister of this country, and too wide in its political and fiscal considerations to be dealt with effectually by any single department of the Government.

"They, therefore, respectfully decline to adopt Mr. Gladstone's suggestion that they should address themselves to the Privy Council Office."

"*Mr. Gurdon to the Secretary of the Society of Arts.*"

"SIR,—I am directed by Mr. Gladstone to acknowledge the receipt of your letter of the 18th inst., and to request that you will be kind enough to acquaint the Council of the Society of Arts that the intention of the reply to your communication of July 3 was to point out that, in regard to a subject of the nature of that which you brought before him (viz. the beneficial action of the Bethnal Green Museum), which falls properly within the province of a department of the State appointed to deal with it, the First Lord of the Treasury could not take the initiative out of the hands of that Department.

"This Mr Gladstone would be doing were he to receive the proposed deputation, and he would be acting contrary to the rules of administration which are necessary for the conduct of public business.

"If, however, the Society of Arts think fit to favour him with a written communication, Mr. Gladstone will himself correspond with the proper department concerning it."

"*The Secretary of the Society of Arts to the Right Hon. W. E. Gladstone, M.P.*"

"SIR,—The Council of the Society of Arts have

directed me to reply to Mr. Gurdon's letter of July 22, in which he states that, 'if the Society of Arts think fit to place before you a written communication, you would yourself correspond with the proper department concerning it.'

"The deputation which desired to have the honour of waiting on you, and explaining in detail the objects of the memorial, would have stated that, in their view, the experiment of the Bethnal Green Museum is suggestive of the following points—

"1. That a general popular desire exists for such museums, and that it would be good national policy for the Government to encourage the establishment of them.

"2. That like primary elementary schools, it would be impossible that such museums could, without State aid and inspection, become part of a national system, aiding technical instruction and secondary education.

"3. That this question, unfettered by any denominational difficulties, is quite ripe for solution; that the necessary expenditure for aiding museums of science and art would be advantageous from every point of view, even remunerative as respects commerce, and, further, would be auxiliary in promoting morality and social good order.

"4. That such museums are absolutely necessary to the industrial progress of the country, which is behind other countries already in the possession of them.

"5. That the time has come when it is necessary that all public museums and galleries of works of science and art receiving Parliamentary aid, should be brought under an intelligible system of administration, controlled by a responsible Minister of State, so as to render them auxiliary to the development of local museums and galleries.

"The Council submit that these are subjects not only of general policy, but involve some new principles of administration, large financial considerations, the reform of old institutions, &c., which it is the province of the general Government, and not of any single department, to deal with. The Council especially desired that the answer they might receive should come direct from yourself as Prime Minister. They could not hide from themselves the knowledge they possessed of the several departmental difficulties which attended the opening of the Bethnal Green Museum, and that they had been made cognizant, through Parliamentary returns and the revised estimates for 1871-2, of the opposition which the Treasury, as lately administered, had persistently offered to carry into effect the decisions made by Her Majesty's Government in 1866, for conducting the Bethnal Green Museum.

"The Council respectfully request you to have the kindness to bring this memorial before Her Majesty's Government. They hope it will meet with favourable consideration, and lead to decisive action, and they will feel obliged by receiving an answer upon it at as early a period as convenient."

"*Mr. Gurdon to the Secretary of the Society of Arts.*

"SIR—Mr. Gladstone desires me to acknowledge the receipt of your letter of October 6th, the contents of which he will not fail to make known to his colleagues."

III.

Resolutions of the Council of the Society of Arts passed at their last Meeting—

"1. That the undermentioned persons be invited to serve on a Standing Committee for the purpose of bringing under parliamentary responsibility the National Museums and Galleries, so as to extend their benefits to Local Museums, and to make them bear on public Education. The following are the several objects in view for effecting this purpose—

"2. All Museums and Galleries supported or subsidised by Parliament to be made conducive to the advancement

of Education and Technical Instruction to the fullest extent, and be made to extend their advantages to the promotion of original investigations and works in Science and Art.

"3. To extend the benefits of National Museums and Galleries to Local Museums of Science and Art which may desire to be in connection, and to assist them with loans of objects.

"4. To induce Parliament to grant sufficient funds to enable such objects to be systematically collected, especially in view of making such loans.

"5. For carrying out these objects most efficiently, to cause all National Museums and Galleries to be placed under the authority of a Minister of the Crown, being a member of the Cabinet, with direct responsibility to Parliament, thereby rendering unnecessary, for the purpose of executive administration, all unpaid and irresponsible trustees, except those who are trustees under bequests or deeds, who might continue to have the full powers of their trusts, but should not be charged with the expenditure of Parliamentary votes.

"6. To enter into correspondence with all existing Local Museums and the numerous Schools of Science and Art, including Music, now formed throughout the United Kingdom, and to publish suggestions for the establishment of Local Museums.

"7. Also, to cause the Public Libraries and Museums Act (18 and 19 Vic c lxx.) to be enlarged, in order to give local authorities increased powers of acting.

SPENCER'S DESCRIPTIVE SOCIOLOGY

Descriptive Sociology, or, Groups of Sociological Facts.

Classified and arranged by Herbert Spencer. No. 1.

—English; compiled and abstracted by James Collier.

(London: Williams & Norgate.)

NOT long since, an announcement appeared in NATURE of Mr. Herbert Spencer's plan of publishing, not a complete and finished treatise on Socio-

logy, but a collection of classified materials for the use of students and investigators. The origin of this important work is explained in the following extract from the preface to Part I., which has now appeared.

"In preparation for the *Principles of Sociology*, requiring as bases of induction large accumulations of data, fitly arranged for comparison, I, some five years ago, commenced by proxy the collection and organisation of facts presented by societies of different types, past and present: being fortunate enough to secure the services of gentlemen competent to carry on the process in the way I wished. Though this classified compilation of materials was entered upon solely to facilitate my own work; yet, after having brought the mode of classification to a satisfactory form, and after having had some of the tables filled up, I decided to have the undertaking executed with a view to publication, the facts collected and arranged for easy reference and convenient study of their relations, being so presented, apart from hypotheses, as to aid all students of Social Science in testing such conclusions as they have drawn, and in drawing others."

An objection to this scheme, which struck most who noticed its announcement, was that materials thus arranged would form a patch-work of dead scraps, rather than an organic whole. The specimen which was first circulated, relating to one of the barbaric grades of culture, confirmed this unfavourable expectation. Now, however, that a section of the actual work has been published, it is evident that the scheme can be made to carry an interest of its own, and even to serve an educational purpose. This first section is a methodical summary of the development of England, intellectual and moral, from the beginning of its history in Cæsar's time, to about A.D. 1850. At the first glance, it suggests a question which may disconcert not a few of the lecturers and tutors engaged in training students in history at our Universities. This question is, whether the ethnological record of national life ought any longer to be treated as subordinate to the political record of the succession of rulers and the struggles for supremacy of ruling families, or whether the condition of society at its successive periods is for the future to be considered as the main subject, only marked out chronologically by reigns, battles, and treaties. This question has, it is true, been already raised. It is, in fact, the issue between historical chronicle and the philosophy of history as rival subjects of study. But Mr. Spencer's work brings it more clearly and practically into view than any previous one, as will be seen from the following outline of his scheme. It consists of two parts.

The first part is a series of tables, arranged in thirty to thirty-five columns, each with a heading of some department of social life or history, which again are combined into groups. Thus the group of columns relating to the structure of society takes in political, ecclesiastical, and ceremonial departments, under which again we find separately given the laws of marriage and inheritance, the regulation of tribes and castes, the military and ecclesiastical organisation, and the ceremonies and customs of daily life. Next, the group of columns devoted to the functions of society, regulative and operative, contains particulars of the morals, religion, and knowledge of each age, the state of language, and the details of industry,

commerce, habitations, food, clothing, and artistic products. Three special columns at the beginning, middle, and end of this long colonnade, contain the skeleton of ordinary history: namely, the principal dates, names of rulers, and political events. Thus, by glancing across any one of the huge double pages, we see the whole condition of England at any selected period. Thus, in the century after the Norman Conquest, the influence of the invaders is observed in the growth of architecture, painting, music, poetry, the introduction of new food and more luxurious living, the importation of canonical law and of mathematics from the East, and so on through all the manifold elements which made up the life of noble and villan in our land. If the page be turned to the 16th century, the picture of English life is not less distinct. The scholastic philosophy is dying out, men's minds are newly set to work by the classical revival, by voyages into new regions, the growth of mercantile adventure and political speculation, chivalry wanes, archery declines; judicial torture is introduced, the "Italian" crime of poisoning becomes frequent, the ancient belief in witchcraft and pervading demons holds its ground, as do the miracle-plays and local festivals; but a highway act is passed, new roads are being made, the new houses have chimneys, their furniture and fare become more luxurious; the power of the old feudal families is destroyed, the Star-Chamber is new-modelled; church-fasts are still observed under pain of imprisonment, and high offices of state are still in the hands of churchmen, but among the signs of momentous change come the dissolution of monasteries, and the distinct appearance of a sect of Protestants. Thus the tabulated record goes on till it ends near the present day, among such items as Trades'-Unions, Divorce Courts, the Manchester School, County Courts, Free Thought, Railways, Rifled Cannon, Pra-Raphaelism, Chartism, Papal Aggression, and the crowding events of modern manufacture and science.

It is by following the several columns downwards, that the principle of Evolution, the real key to Mr. Spencer's scheme, is brought out into the broadest light. It seems most strange, however, that he should not have placed in its proper niche the evidence of pre-historic archaeology. Mr. Spencer can hardly doubt that the stone implements found in England prove the existence of one, or probably two, stone-age populations before the Kelts, who, under the name of Ancient Britons, begin his series. If he acknowledges this, why should a first link so important in his chain of evolution have been dropped? Otherwise the chain is carefully stretched out so as to display it from end to end. In many matters simple and direct progress is the rule. From the Ancient Briton's bow with its bronze-tipped arrows, to the cross-bow, the matchlock-gun, and thence through successive stages to the rifled breech-loader; from the rude arithmetic before the introduction of the "Arabic" numerals, through the long series of importations and discoveries which led to the infinitesimal calculus in its highest modern development; from the early English astronomy, where there was still a solid firmament studded with stars, and revolving on the poles about the central earth, to the period when the perturbations of planets are calculated on the theory of gravitation, and the constitution of the fixed stars examined by the spectroscope—these are among the multitude

of cases illustrating the development of culture in its straightforward course. Harder problems come before us, where we see some institution arise, flourish, and decline within a limited period, as though resulting from a temporary combination of social forces, or answering only a temporary purpose in civilisation.

To take an instance from Mr. Spencer's Table, English history has seen the judicial duel brought in at the Conquest, flourishing for centuries, declining for centuries more, till its last formal relic was abolished in 1820. Again, in the Old English period, marriage appears as a purely civil contract, on the basis of purchase of the wife; then with Christianity comes in the religious sanction, which by 1076 had become so absolute that secular marriages were prohibited: with a strong turn of the tide of public opinion, the English Marriage Act of 1653 treated marriage as a civil contract, to be solemnised before a justice of the peace; till after a series of actions and re-actions, in our own day the civil and ecclesiastical solemnisation stand on an equal footing before the law. Closely similar has been the course of English society on the larger question of a National Church, which, soon after the introduction of Christianity, claimed an all but absolute conformity throughout the nation, practically maintained the claim for ages, and then was forced back to toleration, which has at last left it with a supremacy little more than nominal. This is not the place to discuss these subjects for themselves, but to show how the table before us, by its mere statement of classified events in chronological order, must force even the unwilling student to recognise processes of evolution in every department of social life. The writer of the present notice once asked an eminent English historian, a scholar to whom the records of mediæval politics are as familiar as our daily newspaper is to us, whether he believed in the existence of what is called the philosophy of history. The historian avowed his profound distrust of, and almost disbelief in, any such philosophy. Now it may seem a simple matter to have tabulated the main phenomena of English social and political history in parallel columns, as Mr. Collier has here done under Mr. Spencer's direction, but his tables are a sufficient answer to all disbelievers in the possibility of a science of history. Where the chronicle of individual lives often perplexes and mystifies the scholar, the generalisation of social principles from the chronicler's materials shows an order of human affairs where cause and effect take their inevitable course, as in Physics or Biology.

It may be objected, however, that summing up complex events in short headings, and arranging these in columns, is a rough and ready method often leading to erroneous inferences, and even liable to gross error. It is evidently in order to guard against this that Mr. Spencer follows the first part of his scheme by a second. Here, under their proper headings, the passages from standard authorities which vouch for the brief statements in the tables are given in full, and with references. This part of the work, much the largest in extent, is thus an elaborate historical commonplace-book, containing some thousands of selected quotations. Mr. Collier is on the whole to be congratulated on the completeness of his reading, and the discrimination with which he has chosen his passages. So much information, encumbered with so

little rubbish, has never before been brought to bear on the development of English institutions. There is hardly a living student but will gain something by looking through the compilation which relates to his own special subject, whether this be law or morals, education or theology, the division of labour or the rise of modern scientific ideas. Of course it is very far from perfect. There are some actual blunders; a weak authority is often taken where a strong one was to be had; small matters are often put in, and large ones left out; the want of notes leaves no opportunity of correcting an author's half-true statement. Thus under the heading of Accessory Institutions, there is a good account of the Royal Institution and the Pharmaceutical Society, and a mention of the Russell Institution and the Swedenborg Society, but not a word of the Royal Society. An extract from the Pictorial History of England ascribes the system of Sunday Schools to Mr. Robert Raikes, of the *Gloucester Journal*, about 1780, whereas their real inventor, Jonas Hanway, flourished at an earlier date. Again, under the heading of Religious Ideas and Superstitions, various slips are to be noticed. It was natural enough that, years ago, Brand should, in his *Antiquities*, have considered the country rite of throwing toast to the apple-trees to secure a fruitful year as being a "relic of the heathen sacrifice to Pomona;" but a modern reader quoting him, should never in Brand's old-fashioned way have dragged in a Roman deity to account for a genuine English superstition. Just below this is the following sentence in brackets, and without an author's name.—"The resistance of tides in the Wash caused by their meeting with the ebb-waters is called the *Ægar*—one of the gods of the Scandinavian mythology." This statement is misleading, and not the less so for having a real etymology hidden behind it. Our English word *ægar*, signifying the "bore" of an estuary, is Anglo-Saxon *ægar*, the sea, and its use merely asserts the plain fact that the sea runs up the channel. It is true that there is a corresponding old Norse word *ægir*, the sea, and that this in Scandinavian mythology becomes the personal name of *Ægir*, the Sea-god. But it does not follow that our eastern countries' word had ever any such mythological notion attached to it. These happen to be the first weak points which struck the writer in glancing over a page or two in quest of errors. It is needless to continue this critical process on a professed book of extracts; enough has been done to show that the proper use of such a work as the present is not so much to furnish the scholar with complete second-hand ideas, as to indicate how the ideas lie and where they may be obtained first-hand.

Mr. Spencer, out of the evidence amassed by the readers collecting facts under his direction, might have made an admirable treatise of the usual kind on the History of English Civilisation. No doubt, however, for years to come lectures will be delivered and articles written full of suggestive facts in the history of culture, which the initiated will recognise as borrowed from the unwieldy pages of this present atlas-like compilation. In the meantime, we may hope that Mr. Spencer's scheme may be carried out through the whole range of savage and civilised life, and that his tables of development of culture (printed on one side of the paper as if in anticipation of such use), may be set up like maps on the

walls of class-rooms. They are certainly to be compared with maps for the range and precision and correlation of parts with which they show their contents at a glance.

E. B. TYLOR

OUR BOOK SHELF

Aus der Urzeit. Bilder aus der Schöpfungsgeschichte, von Prof. Dr. Karl A. Zittel, in München. Mit 78 Holzschnitten. (München Rudolph Oldenbourg, 1871 2.)

THIS is one of a series of popular works on Science entitled "Die Naturkräfte," that are being published at intervals by Herr Oldenbourg, of Munich. Prof Zittel, in his preface to the present work, speaks of the vast influence which popular scientific literature is calculated to have upon the entire development of a people, and therefore insists on the great importance of diffusing, in an intelligible manner, among the people thoroughly correct notions of every science, instead of muzzling down scientific truths until they lose all that is characteristic or informing. It is, perhaps, of far more importance that scientific books meant for the people should be as absolutely correct and as far advanced as it is possible to be, than those intended for scientific men themselves. The latter can discover and reject the false or imperfect; the former in their ignorance accept what is written as the truth, and the injury thus done is often serious in its consequences and may take a generation or longer to remedy. Popular scientific works, like school text-books of science, ought to be written only by those who are thoroughly masters of their subjects. The book before us seems to us to be in this respect satisfactory. In a series of chapters, each corresponding mainly with one of the great geological periods, the author endeavours to present a series of pictures of the gradual development of our earth, mainly with reference to the life which it supports. He seems to know his subject well in all its aspects, and presents in an interesting and intelligible way the latest results of geological research, with the conclusions derived therefrom by the most advanced thinkers. The illustrations are very good, and the work as a whole is a good specimen of a popular scientific treatise.

LETTERS TO THE EDITOR

[The Editor does not hold himself responsible for opinions expressed by his correspondents. No notice is taken of anonymous communications.]

Remarkable Phenomena

It may be within the memory of some of your readers that between the 15th and 20th August, 1868, a succession of waves reached Sydney, and were recorded by the self-registering tide-gauge. The average interval between the waves was about 25 minutes, and the greatest oscillation 34 inches, measuring from the crest of one wave to the hollow of the next. It was thought at the time that they were earthquake phenomena.

A similar visitation has just reached us, but it was not so marked in its character. The self-registering tide-gauge shows that the disturbance began during the afternoon of the 15th, and attained its maximum between 1 A.M. and 4 A.M. of the 17th, the greatest oscillation, amounting to 5 inches, occurred between 3.15 A.M. and 3.33 A.M. of the 17th, the average interval of the waves at this time was 25 minutes, but the average of 20 between 8 P.M. and 5.30 A.M. was 28 minutes. The waves cannot be traced beyond the 18th.

On the afternoon of the 16th we had a thunderstorm, during which the barometer was very unsteady, and the barograph sheets show some peculiar curves; strange to say, the average

interval of the 5 most conspicuous of the barometer curves or waves between 5.40 P.M. and 7.30 P.M. is 25 minutes, the largest oscillation was 0.045 in. of mercury, equal to about 6 inches of water. Just before daylight on the morning of the 17th several fine meteors were seen to N.E., but the observer who reported them to me did not make notes of particulars. At Newcastle, which is a port 60 miles north of Sydney, I have another self-registering tide-gauge, which recorded a disturbance similar to the Sydney one, it began on the afternoon of the 15th and was greatest between 8 P.M. of 16th and 7 A.M. of 17th, the greatest oscillation, 9 inches, occurred between 12.15 A.M. and 12.30 A.M. of 17th, and the average interval of all the waves from 8 P.M. to 5.30 A.M. of 17th, amongst which are several that only occupied 5 minutes, and look like double oscillations, is 20 minutes.

Struck by the circumstances that both sets of waves, though separated by an interval of 5 years, occurred in August, I determined to examine all the tide-gauge sheets since 1866, when the instrument was set up, and was surprised to find a repetition of it every year, the amounts were too small individually to attract notice, but are nevertheless unmistakable, the periods are as follows —

1866	August	9th to 10th, and again 15th to 21st
1867	"	5th,, 13th, very marked from 9 A.M. to midnight of 12th
1868	"	15th,, 20th, remarkable (see beginning of this letter).
1869	"	11th,, 17th
1870	"	12th,, 22nd, marked from 5 P.M. of 17th to 4 P.M. of 18th
1871	"	9th,, 10th and 20th to 21st.
1872	"	10th,, 13th
1873	"	15th,, 18th, as recorded in this letter

It is not easy to believe that earthquake phenomena will recur with such regularity, and we must seek another cause depending it would seem on the earth's annual motion, and to a certain extent affecting air and ocean alike.

It would be premature to express a decided opinion without further investigation, which I have not had time to make yet, but it seems very probable that the August meteor stream through or near which the earth passes about 10th August may be the cause. It will be observed that even in the few observations given above there are indications of a five-year period, for the double disturbance of 1866 is reproduced in 1871, and the great disturbance of 1868 is followed by a similar one in 1873.

Sydney Observatory, Aug. 23

H C RUSSELL

Periodicity of Rainfall

I DO not altogether agree with Governor Rawson when he says, in his interesting letter in NATURE, vol. viii p. 245, that "the experience of Barbados is opposed to the theory broached by Mr. Meldrum and Mr. J. N. Lockyer." On the contrary, I rather think that Mr. Rawson's figures support the theory. He has taken 1846 and 1871 as middle maxima years (in my first paper I also took 1848), whereas 1849 and 1872 are probably more correct. Making this slight alteration, we get, according to Mr. Rawson's statistics, —

	Years	Rain In	Summ In
Min.	1843	45.31	163.67
	1844	74.45	
	1845	43.91	
Max.	1848	63.77	184.42
	1849	52.77	
	1850	67.88	
Min.	1855	77.31	186.70
	1856	48.49	
	1857	60.90	

Years.	Rain in In	Sums. in
Máx. { 1859 .. 56 22		187'95
1860 .. 57 91

524 58, showing an ex-

cess of 2 64 in on the maximum side

The quinquennial periods, as far as they admit of comparison, give also an excess in favour of the maxima years.

The heavy falls in 1844 and 1855, and the comparatively small fall in 1872, are apparently opposed to the theory, but it should be borne in mind that rainfall is greatly affected by local causes, and that to reveal the effects of a weaker but more general cause we must, as far as possible, eliminate chance, by comparing the total falls in maxima and minima periods. Tried by this preliminary test, the experience of Barbados can scarcely be said to be opposed to the theory.

My main object, however, is to draw attention to some discordances between Mr Rawson's figures and those given by Mr Symons in *NATURE* (vol vii p 143), for until this disagreement be explained, there will be considerable uncertainty respecting the rainfall of Barbados. The following table will show where the two statements are at variance —

Years	Rain (Mr Symons)	Rain (Mr Rawson)
Min. { 1843 .. 45 5		45 31
1844 .. 74 5	163 7	74 45
1845 .. 43 9		43 91
Max. { 1847 .. 42 5		48 10
1848 .. 52 8	158 3	63 77
1849 .. 53 0		52 77
Min { 1855 .. 73 5		77 31
1856 .. 46 4	170 7	46 49
1857 .. 50 8		60 90
Max { 1859 .. 55 1		56 22
1860 .. 60 4	186 6	57 91
1861 .. 71 1		73 82

The greatest differences are in 1847, 1855, and 1857, and amount (for these three years alone) to 19 4 in

It is worthy of remark that both statements show an excess on the side of the maxima years, Mr Rawson's of 2 2 in, and Mr Symons's of 10 5 in. But how did such great differences arise.

A remark made by Mr. Rawson may explain the matter. He says "the average of the island for twenty-five years, from 1847 to 1871, is 57 74 inches, based upon the mean of three stations in 1842, and increasing to 141 in 1871." Now it would be useful to know how the mean yearly rainfalls were determined. Is the fall given for 1844 (74 45 inches) a mean of the falls at three stations, and the fall for 1872 (48 39 inches) a mean of the falls at 141 stations? If so, and if the other yearly means were similarly obtained, Mr. Symons may not have taken the same number of stations as Mr. Rawson. Yearly means thus determined would not of course be comparable, for even in a small island the rainfall varies greatly according to locality. The rainfall in maxima and minima sunspot years cannot be fairly compared except by taking the same number of gauges and the same stations, and it is desirable that the falls in the intervening years should be given.

"Assuming that sunspots affect all parts of the globe equally, and that periodicity prevails in all *climates*," Mr. Rawson, with the above experience of Barbados before him, is "led to the conclusion that it was 'chance alone' that led to the coincidences noticed by Mr. Symons." Now the theory makes neither of these assumptions. It assumes that there is a sunspot periodicity; that this periodicity implies a secular variation of solar heat and

radiation; that, therefore, there is a corresponding periodicity of temperature, wind, and rain on our earth; but that, from various counteracting causes, the observations at some stations will not show a periodicity, while those at a large majority of stations, and a mean of all the observations, will do so. In short, with respect to rain, the theory assumes that the annual fall over the globe is subject to a variation, corresponding with the sunspot variation, but that from disturbing influences, local exceptions must be expected. Granting, therefore, that the rainfall of Barbados is opposed to the theory, I do not think it follows that the favourable experience of the British Isles must be owing to chance alone, for that experience is what theory leads us to expect, and it is much more extensive both as to time and space than the experience of Barbados. If England and Barbados were the whole globe, the theory would be well-nigh proved, as far as observation goes; for, according to Mr. Symons's Table 1, there was not, from 1815 to 1864, a single exception to the rule that more rain falls in the maxima years; and if we take the aggregate falls for England and Barbados from 1843 to 1873, it will be found that there was a large excess on the maximum side.

I have now examined 93 rainfall tables from various parts of the globe. They are all I have as yet been able to procure, and they have been published *in extenso*, so that the evidence they afford may be scrutinised. That evidence is such that if no rain at all had fallen at Barbados in the nine principal maxima years since 1843, and the rainfall in the nine minima years were to be put in the other scale of the balance, there would still be a large surplus in favour of the theory. Up to the present time the more numerous the observations, the stronger the evidence. Still I shall be prepared to abandon the theory whenever a preponderance of undoubted facts may be brought against it. But I see no prospect of this, for the rainfalls of England, Scotland, the Continent of Europe, India, Africa, America, and Australia, as far as they have yet been examined, sustain the theory.

Mauritius, Sept 15

C MELLORUM

Dr Sanderson's Experiments and Archeiosis

DR SANDERSON has strangely misunderstood the wording of my letter which appeared in *NATURE* on the 9th inst. Any one may see that I did not challenge him to "deal" with my main proposition "that Bacteria are capable of arising in fluids independently of living reproductive or germinal particles." That position was merely alluded to by me in order to show the relevancy of the question which I asked Dr Sanderson and the question itself was—"Whether he still believes that Bacteria are created by a temperature of 100° C in fluids, and if not upon what grounds he has changed his opinion?"

Whilst tacitly declining to answer this question, Dr Sanderson now says, "I hope that Dr Bastian will allow me to decline to enter on the general question." But it is precisely because Dr Sanderson has distinctly expressed himself upon the general question both at the late meeting of the British Association and in your columns (*NATURE*, vol. viii p 181), that I feel he may, both from a moral and from a scientific point of view, be called upon to reply to the question above quoted.

The need that Dr Sanderson should express the grounds of his opinion concerning the death point of Bacteria in heated fluids is further shown by Mr Ray Lankester's communication in last week's *NATURE*, in which he says, "Dr Sanderson does not believe that there is a definite relation between the precise temperature to which the infusion is exposed and the destruction of Bacterian contamination." Now if this is really Dr Sanderson's present opinion, it may not inappropriately be asked whether it is an opinion based upon definite evidence or whether it is a mere surmise? I say the question is not inappropriate because, as Dr Sanderson will recollect, I have heard from his own lips, since his return from Bradford, that he has made no definite observations upon the subject, and that he is quite unprepared to question the truth of the experimental evidence which I have recently brought forward (Proc. of Royal Society, Nos. 143 and 145) showing that Bacteria are killed in fluids which have been raised for five minutes to a temperature of 66° C (140° F).

Dr Sanderson previously supposed that Bacteria were incapable of appearing and rapidly multiplying in certain fluids

* I should have hesitated about referring to what has passed in conversations between Dr Sanderson and myself, if he had not set the example both in your columns (*NATURE*, vol viii p. 181) and in a discussion at one of the meetings of the Royal Society.

raised to 100° C. and subsequently protected from contamination. He has been convinced that his supposition on this subject was erroneous. And since this period, whilst I have been careful to undertake fresh researches concerning the death point of Bacteria, he has been content to rest in the stage of mere supposition on this most important point, and is now, as it appears, quite unprepared to question the truth of my assertion that Bacteria are killed at 60° C. It is right that the public should know this, and I only regret that Dr. Sanderson himself cannot be induced to inform them as to the real extent of his knowledge upon this part of the subject.

Foreign Orders

THE acceptance and refusal of foreign orders by British subjects has hitherto been universally misunderstood. The existence of the Queen's Regulations, which you have reprinted in your columns (vol. viii p. 481), prohibiting the receipt of these orders without special permission, must, after the discussion which took place in the House of Commons during last session, surprise many of your readers, who will naturally ask why regulations so stringent and so habitually disregarded, have been either kept entirely private in the Foreign Office, or, if published, have never been followed up. As it is, I will venture to say that not one out of some hundreds who have received foreign orders are aware of the prohibition or have any obvious means of becoming aware of it. Announcements of the presentation to British subjects (and it is assumed acceptance of by them) of such orders habitually appear in the most conspicuous type of the most widely circulated papers, but never a hint on the part of the Foreign Office that the recipients are violating Her Majesty's rules, as drawn up by itself and signed by the Secretary of State for Foreign Affairs.

Such being the case, it is somewhat singular that the Foreign Office should issue regulations approved by Her Majesty, forbidding British subjects to accept or to wear foreign orders and their decorations, except in the very rare cases in which Her Majesty's permission is obtainable, and yet take no steps through its agents at foreign courts to instruct the habitual givers that Her Majesty not only disapproves of their action, but requires of her subjects to tell them so in the most ungracious of all ways, namely by refusing to accept their favours, and returning the tokens thereof.

Surely if the prohibition to accept is wise and good (and I am the last person to doubt Her Majesty's wisdom) the obvious course for the Foreign Office to pursue is to inform all foreign Sovereigns of the fact, and instruct British subjects to transmit any orders that they may receive or have received to the Foreign Office to be returned to the sovereign who sent them, if the services of the recipient are not of such a nature as to enable him to obtain permission to accept them.

Into the merits of the prohibition I am not disposed to enter at much length. That foreign orders are comparatively valueless in themselves is generally admitted, and it is well understood that not a few are to be had for the asking by men of real or supposed eminence, and others by solicitation from men of no eminence at all, or of doubtful eminence. It would surprise you readers to know how many of these orders there are in the possession of their countrymen, whose habitual disregard of such honours leads them in most cases to toss them into a drawer and say nothing about it to any one but their wives, who think they would suit their necks better than their husbands' long-tailed coats.

Some few (very few) no doubt have a definite scientific or literary value; but so long as the British public are entirely ignorant of this value, they will be held in no higher estimation than the others, nor do I see any way by which the value of a foreign order could be made known and recognised, or by which the title of the recipient to wear it could be ascertained.

I believe that it is to the rarity of British orders that any desire to obtain foreign ones is mainly due. Had we more, or none, their value would diminish or expire; and, however, I am not prepared to propose either the restriction or multiplication of British orders, a third alternative might be suggested to the Foreign Office, and that is the command to wear them if accepted; which would result in a display in our *societis* and assemblies of which men of eminence would be heartily ashamed, and lead to a petition for relief, that would be followed by an abandonment of the practice of giving by the powers that be. D.C.L.

Mr. Forbes on Mr. Mallet's Theory of Volcanic Eruption.

I DO not intend to depart from my purpose, as stated in my last (NATURE, vol. viii p. 485), to have done with further controversy. I must, however, beg your permission to correct a statement as to a matter of fact which constitutes the prominent feature of Mr. D. Forbes' letter on the above, and which is published in the last number of NATURE.

Mr. Forbes says, and begs your readers to remember that his remarks [namely, in his original review of my translation of "Palmer's"] were altogether directed to the assertions contained in my introductory sketch, and not comments upon my theory of volcanic energy—of which Mr. Forbes now says we, viz., he and your readers, as yet know little or nothing. That is to say, nothing beyond what is given in the abstract in the Proceedings of the Royal Society and in my Introduction to Palmer.

Mr. Forbes' review (NATURE, vol. viii p. 259) which called forth this correspondence, was no doubt confined to my translation of, and introduction to, "Palmer's Volcanism," &c. But in that same introduction was contained a sketch of my theory of volcanic energy—upon which Mr. Forbes deemed himself warranted to make his sweeping condemnation—that it was not probable that this hypothesis will receive the adhesion of either chemist, mineralogist, or geologist.

If this were not a comment upon my theory of volcanic energy I know not what a comment means.

My complaint has been that it was a comment condemnatory—based on erroneous as well as inapplicable premises—and made at a time when, as Mr. Forbes himself in his last admits, he knew very little about that theory, as fully expounded in my paper in the Phil. Trans.

ROBERT MALLETT

Oct. 28

Settle-Cave Report

I HAVE just read with considerable astonishment Mr. Tideman's letter (NATURE, October 23) relating to an abstract which I never saw till to-day, and for which, therefore, I am not responsible. The whole question of the antiquity of cave-deposits as well as that of those in the Victoria Cave, in particular is treated in my work on "Cave-Hunting," shortly to be published, and therefore I see no reason for entering into any argument based on the distribution of the Pleistocene Mammalia, or to depart from my rule of not entering into a controversial correspondence.

W. HOID DAWKINS

Owens College, Manchester, Oct. 24

The Oxford Science Fellowships

I WRITE to confirm Prof. Clifton's letter (in the last number of NATURE) respecting Mr. Perry and Oxford Science Fellowships. Nothing, it seems to me, can be more conclusive than the way in which Mr. Perry's letter has been answered. Any remark further of mine on this point would be superfluous.

I will only say that, in the practical part of the examination, no subject could have been chosen better fitted for giving perfectly fair play to all concerned. If it were possible to imagine that any advantage was given, it was, by the choice of the subject, given to those who were unacquainted with the University laboratory.

In conclusion—far from being looked on as an unwelcome intruder, I met with from all, whether candidates or examiners, the most generous courtesy and kindness.

Cambridge, Oct. 24

THE CAMBRIDGE B.A.

PROFESSOR CLIFTON cannot have considered what a great mistake I have been the victim of, or he would not in his hastily written attempt to defend the general science arrangements at Oxford, have forced me to the following explanation. He knows that I stated my case fairly, and he might surely have given credit for this whilst letting us have the benefit of his later information.

I. I have not at hand a copy of my letter to the Warden. I am quite sure that I told him I was a graduate of the Queen's University in Ireland. The Warden simply directed me to the short notice in the *Times* (afterwards given in your columns), and that the election would not be limited to graduates of Oxford, and would altogether depend on the results of the examination held at Merton on Oct. 7. I thought this letter perfectly satisfactory.

as to my eligibility, as did several Oxford graduates to whom it was shown. I shall presently refer to Prof. Clifton's "warning."

The examination was to begin on Oct. 7, at 9 A.M. On presenting myself, a gentleman whose name I do not know, told me that the Physics papers would not be given out before Oct. 10, that if I felt inclined to work the paper given to candidates for the Mathematical Fellowship I might do so, and credit would be given for Mathematics in the event of two men being equal in the Physics examination. I shall not comment on this promising arrangement, or on the fact that the candidates for the Physics fellowship had not till then heard of the Mathematical paper. Our informant told me that there were grave doubts as to the eligibility of outsiders. He certainly gave me to understand that these doubts extended to all who were not Oxford graduates. I understood that some Cambridge men had presented themselves also, that the question of our eligibility was about to be settled with the Registrar of the University, and that if I called on the Warden between four and five in the afternoon (the time mentioned in the original notice) he would be provided with the results of the deliberations.

At 4.30 I found the Warden about to go away somewhere. I had an audience of about two minutes. I was asked what College I belonged to (meaning in Oxford)—Not an Oxford man, I answered.—Then he was afraid I was ineligible. I then informed him that I was the graduate of the Queen's University, to whom he had written in June. I suppose he had very little time for apologies, but he let me know, before leaving, that he had misinterpreted the results of some late commission when he wrote in June, and that I need have no hope.

I have stated the grounds for my former general statement. If Prof. Clifton is certain that graduates of Dublin and Cambridge are eligible, we must rely on his information being most correct, but I am troubled to know who is answerable for my being left in ignorance until now, and if anybody knows whether my elections are under made of men who would really be ineligible by the laws of the University.

2. He insinuates a deception on my part, in not mentioning his "warning." I take it that Prof. Clifton has partly forgotten the matter of which he speaks. I wrote to him for leave to inspect the Physical Laboratory at Oxford, not certain that he was one of the examiners, but aware that he had charge of that institution and that the examination must be held there (see 3). I did not speak of my eligibility.

There is no doubt about the fact that great difficulties are thrown in the way of outsiders, but I should have been wrong if I had laid any blame on Prof. Clifton for taking the only course open to him. The case is simply this: according to the present Physics arrangements at Oxford, outsiders preparing for the October Fellowship examination at Merton could not without giving the greatest imaginable trouble to Prof. Clifton get any opportunity of inspecting the apparatus.

After stating that he was unable to afford me the desired opportunity, he asked if I had ascertained about my eligibility, informing me that the warden or sub-warden was the proper person to apply to. I immediately wrote that I had already made such an inquiry, stating the result.

I now infer that he, after receiving my letter and aware that I had made the proper inquiries, allowed both the Warden and myself to remain in ignorance of the grievous mistake. On receiving no answer I felt perfectly certain that the information received from the Warden was correct.

When I last wrote to NATURE I felt grateful to Prof. Clifton for his inquiry, incomplete and worse than useless "warning" as it had been. Surely no one will think that I had any right to introduce his name.

3. He says it was by no means certain that the Practical Physics examination would be held in the Physical Laboratory. Will he assert that in any one of the nineteen colleges, of which he speaks, or in the nineteen collectively there is apparatus for conducting such an examination?

He wonders why it should be necessary to inspect the particular apparatus to be employed in the examination. I do not know if Prof. Clifton was really one of the examiners for the fellowship, but surely he cannot have thought about the matter without being aware of the immense importance of a previous acquaintance with the apparatus such as Oxford men are sure to have. I heard by accident in July that there was no delicate apparatus, nor were proper arrangements made for exact experiments in Static Electricity. Can Prof. Clifton not understand that to an outsider such information might be of the greatest importance.

"What arrangement of telescope stand is there for measuring wave-lengths?" "Is there a Soleil's instrument for measuring the angle between the axes in biaxial crystals?" "Will the arrangements for observing deflections of a needle enable us to employ the logarithmic decrement?" These questions and a hundred others as important were constantly distracting me during the four months of preparation.

My letter to Prof. Clifton was, I believe, modest, and showed my respect for him as a man who had done a great work in his attempt to create a Physics School at Oxford. My request was not "unreasonable." I did not know that his presence was necessary during an inspection of the Physical Cabinet or the University. I maintain too, that he has no right to assert that I must feel very uncertain about my own practical knowledge.

London, Oct. 28

JOHN PERRY

Simple Diffraction Experiment

THE apparatus for this experiment consists of a slit and a grating. A slit may be made by holding a piece of smoked glass. The grating is made by slightly greasing the thumb and forefinger (there is naturally sufficient on the hot and moist hand), and by drawing a piece of clean glass through them so as to obtain alternate parallel light spaces and greasy lines on both sides of the glass, out of several trials a grating may be made which when used in the following manner will give very pretty results.

The grating being placed close to the eye, the slit (with its direction parallel to that of the lines on the grating) is held up before some bright light, as of a candle, and looked at, as if the grating did not exist. Very beautiful and numerous spectra may then be seen ranged on each side of the slit.

The vitreous surface of window glass does not seem to give such good gratings as a worked and polished surface, as for instance that of a weak spectacle lens.

Oxford

H. L.

Publication of Learned Societies' Transactions

IN NATURE, vol viii p. 506 Mr. Rohrs wishes that our learned societies would publish their papers separately. I have urged this before in NATURE, but unsuccessfully. With Transactions such as those of the Royal Society, the present system is almost an absurdity, for papers on most incongruous subjects are bound up together, and the cost is too great. When once a paper is printed, the Council seem to think that there is nothing more to be done, and do not in any way try to make the work known. All papers should be sold separately as cheaply as possible, and on publication, should be advertised in the scientific journals.

If this were done, we should not have men like Prof. Sylvester writing as follows:—"I owe my thanks to M. Radau and the editor of the *Annals of the Ecole Normale* supererogatory for having been at the pains to disentomb the little known conclusions contained therein from their honourable place of sepulture in the *Philosophical Transactions*." W. B. GIBBS

EXAMINATIONS OF THE SCIENCE AND ART DEPARTMENT IN BIOLOGY

THE syllabus of the Biological subjects in which examinations are held by the Science and Art Department, has undergone considerable modifications in the edition of the Directory which has been recently issued. Animal Physiology, Elementary Botany (including Flowering Plants only), are subjects which at present appear to be best adapted for the purposes of school instruction. They stand, therefore, in no necessarily logical relation to the other two which are grouped together under the head of General Biology. These involve the use of the compound microscope, and some amount of microscopic manipulation. They are therefore better fitted for rather more advanced, or at any rate, older students than the first stages of the subjects first mentioned.

The two subjects included under General Biology have a common first or Elementary stage. After passing this, the candidate may proceed at choice, either with the zoological or the botanical side.

The following extract from the syllabus will show how this arrangement is intended to work, and will afford the best idea of the direction which the examination is likely to give to elementary biological study. It does all that a written examination can do to encourage practical work, and discourage the prevalent habit of cramming from text-books —

SUBJECTS XVI. AND XVII. — GENERAL BIOLOGY
First Stage, or Elementary Course

Questions will be confined to the following subjects, with which the candidate will be expected to show practical acquaintance

1. The form and size, the results of optical, chemical, and mechanical analysis, the mode of growth and multiplication, the conditions of life, and the results, direct and collateral, of the living activity of *Tortuga*, *Protozoa*, *Amoeba*, *Bacteria*, and of the colourless corpuscles of the blood of man

2. The structure and mode of growth of *Fucus*, its mode of multiplication, the development of *Hydra* and *Mytilus* from ova, the conditions and results of the living activity of this mould

3. The structure and mode of growth of *Chara*, the differentiation of axis and appendages, of nodes and internodes, the structure and arrangement of the nucleated cells of which the body of this plant is composed. The process of cell-division and its laws, protoplasmic movements, Chlorophyll, asexual propagation, sexual propagation. Development of the pro-embryo and of the embryo

4. The structure and mode of growth of a Fern. The differentiation of cells into tissues. Epidermis, parenchyma, fibres, ducts, spiral vessels. The Frond as a respiratory and alimentary organ, air-passages, stomata. Asexual multiplication. Sporangia and spores. Development of spores, structure of the Prothallium. Structure and functions of Archegonia, Antheridia and Antherozoids. Development of the embryo

5. The anatomy and physiology of a flowering-plant, with especial reference to the morphology of the stem and root. Leaves and their modifications. The structure of pollen and ovule. The process of impregnation and the development of the embryo. The resemblances and differences between flowering-plants and ferns

6. The anatomy and physiology of the frog. The general disposition of the parts of the body, and the plan of structure characteristic of the frog as a vertebrate animal. The structural characters of the tissues of which the body is composed and their ultimate resolution into nucleated cells

The physiological properties of the tissues

The form and structure of the chief organs and the modes in which their functions are performed.

The development of the embryo and the metamorphoses of the larva

7. The anatomy and physiology of the freshwater Polype

8. The anatomy and physiology of the Lobster or Cray-fish

9. The anatomy and physiology of the fresh-water Mussel

10. The anatomy and physiology of the Sea-anemone

Second Stage or Advanced Course of Subject XVI

(Division of Animal Morphology and Physiology)

Questions may be set in all the topics enumerated under the first head, and in addition on:—

The leading facts relating to the anatomy and physiology of the skeleton, of the brain, and of the cerebral nerves; of the organs of the higher senses; of the alimentary, circulatory, respiratory, renal, and reproductive apparatus, in the Lamprey, in an osseous fish (Pike or Cod), bird (Pigeon, Fowl, or Duck), in a quadruped mammal (Sheep, Rabbit, Dog, or Cat,) and in Man

2. The morphology of the vertebrate skull and limbs, as exemplified by the *Vertebrata* already mentioned, and by the Dogfish, Horse, Bat, and Porpoise.

3. The general outlines and process of the development of the chick within the egg.

4. The characters of the orders of the *Vertebrata*

5. The broad facts relating to the geographical and geological distribution of the *Vertebrata*.

6. The anatomy and physiology of insects, as illustrated by Blackbeetle, a Bee, a Butterfly, and an Aphid

7. The anatomy and physiology of an Earthworm and of a Leech

8. The anatomy and physiology of a Snake and of a Tape-worm, and the history of their development

9. The anatomy and physiology of the *Rotifera* and of the *Polysa*.

10. The anatomy and physiology of a Sea-urchin (*Echinus*) and the history of its development.

11. The anatomy and physiology of a Snail and of a Whelk, and of a Cuttlefish, Squid, or Octopus.

12. The morphology of the *Hydra*

13. The anatomy and physiology of the *Infusoria*

14. The anatomy and physiology of sponges, *Foraminifera* and *Radiolaria*

Honours

In this examination questions will be set at the discretion of the Examiner, who will have regard to the state of Zoological teaching in the country and the means of acquiring information

Second Stage of Advanced Course of Subject XVII

(Division of Vegetable Morphology and Physiology)

Questions may be set in all the topics enumerated under the first head, and, in addition, on:—

1. The principal modifications in the minute anatomy of the axis in flowering plants

2. The nature of the parts used for support in climbing plants.

3. The various modes of agamogenesis in flowering plants.

4. The leading facts in the development of the parts of a flower, including that of the pollen, ovule embryo sac, endosperm (albumen), and embryo

5. The morphology and relations to one another of the parts of the flower and fruit throughout the class. Dicotyledons and Monocotyledons, more especially as exemplified in the following genera

Ranunculus, *Nymphaea*, *Capella*, *Vicia*, *Stellaria*, *Malva*, *Ceranium*, *Ilex*

Fumonymus, *Vicia*, *Rosa*, *Saxifraga*, *Lythrum*, *Epilobium*, *Antirrhinum*.

Lonchit, *Senecio*, *Campanula*, *Fritia*, *Solanum*, *Plantago*, *Lamium*

Polygonum, *Urtica*, *Viscum*, *Fagus*

Orchis, *Lilium*, *Potamogeton*, *Allium*, *Arum*, *Lemna*, *Typha*

Carex, *Litticum*

6. The various adaptations by which cross-fertilisation is effected in flowering plants.

7. The modes by which seeds are diffused

8. The broad facts of the geographical distribution of Flowering plants.

9. The distinctive characters, and origin of the Arctic-alpine flora, and the flora of oceanic islands

10. The morphology and physiology of the vegetative and reproductive organs in *Pinus*, *Taxus*, and *Juniperus*

11. The geographical and geological distribution of the genera of *Gymnosperms*.

12. The morphology and physiology of the vascular cryptogams, more especially with reference to the following types — *Salvinella*, *Pilularia*, *Lycopodium*, *Equisetum*, *Polypodium*, *Lactuca*, *Osmunda*

13. The morphology and minute anatomy of the Carboniferous *Lycopodiaceae*.

14. The morphology and physiology of Mosses and Liverworts as exemplified by *Polytrichum* (or *Punaria*) and *Murchania*.

15. The morphology and physiology of Algae as exemplified by —

Fucus, *Ceramium*, *Sargassum*, *Spirogyra*, *Closterium*, *Uva*, *Volvox*, *Protozoa*, *Palmitella*

16. The modes of reproduction in Fungi as illustrated by — *Agaricus*, *Penicillium*, *Peronospora*, *Mucor*, *Uredo*, *Saccharomyces* (yeast)

17. The processes of plant nutrition, comparing also their modifications in Fungi, Neotia, and different parasitical plants.

18. The ash constituents of plants and their distribution in the tissues.

19. The influence of heat and light upon plants.

Honours

Questions at the discretion of the examiner, who will have regard to the state of botanical learning in the country, and the means of acquiring information

ON THE SCIENCE OF WEIGHING AND MEASURING, AND THE STANDARDS OF WEIGHT AND MEASURE *

VII.

WEIGHING AND MEASURING INSTRUMENTS, AND THEIR USE

THE instrument universally used for weighing is the balance, with its various modifications. It serves to determine the weight of bodies by comparison with a body of known weight, such as a standard weight. The simplest form of balance is a beam made to vibrate upon a centre of axis of motion, with pans hanging from the extremities of the two arms of the balance. These two pans hold the bodies compared, and their equality or difference of weight can thus be determined.

Balances are of two kinds — 1. Ordinary balances with equal arms, which have the beam suspended by the middle. If an equal-armed balance is accurately adjusted, so that the beam is exactly horizontal when the pans are empty, the beam will also be horizontal, and the balance will be in equilibrium when equal weights are placed in the pans. 2. Balances with unequal arms, in which the beam vibrates upon the centre of motion placed more or less near one of the extremities. In both of these kinds of balance the beams are levers of the first order, the fulcrum upon which the beam vibrates being placed between the power and the weight, that is to say, between the extremities of the beam which support the bodies compared. On the principle of the lever, the power of any weight to move a balance is proportionately greater according as the part of the beam which supports that weight is more distant from the fulcrum or centre of motion of the balance. Hence it follows that the power of the weight to move a balance is in a ratio compounded of the weight itself and of its distance from the centre of motion of the balance. A multiplying or proportionate balance may consequently be constructed for determining the weight of a body placed in the pan suspended from the shorter arm of the bearer, and required to be equal to any multiple of a given unit weight placed in the pan suspended from the longer arm of the beam, termed the weight pan. For this purpose, if the beam be divided into, say three equal parts, and the centre of motion be placed at the first division, one pound placed in the weight pan will form an equipoise with two pounds placed in the other pan, and so on. This principle is greatly extended in larger weighing machines by lengthening the longer arm, through the use of compound levers, so that one pound can be made to form an equipoise with 100 pounds or more.

The ancient Roman balance is perhaps the earliest form of a well-constructed multiplying balance, and corresponds with our modern steelyard. It has been remarked by Sir Gardiner Wilkinson that no instance has been found of the existence of the steelyard before the Roman era. But the principle of its construction was in use amongst the ancient Egyptians, who ascertained the weight of articles suspended from different parts of a scale beam by means of a heavy determinate weight placed in one scale. The Roman balance consists of a determinate weight attached to the longer arm of the beam, and made to traverse along a number of divisions marked upon it. The multiplied power of the traversing weight when resting on the several sub-divisions, as they increase in distance from the centre of motion, is indicated by corresponding figures upon the graduated beam.

The following figure (taken by permission from the "Imperial Journal of Art," vol. 1. p. 85) represents an ancient Roman balance of an elegant form, found at Pompeii, and in use A.D. 77. It is described as having the graduated divisions on the longer arm of the beam marked

with Roman numerals from X. to XXXX. (probably Roman pounds), and with a V. on the half of each decimal series, the smaller subdivisions being also marked. The inscription on the shorter arm of the beam (shown in a separate and enlarged figure) denotes its having been proved at the Capitol in the 8th of Vespasian Emperor Augustus, and in the 6th Consulate of Titus Emperor Augustus his son. This steelyard is consequently a duly verified standard weighing machine.

For the justness of an equal-armed balance, it is requisite (1) that the points of suspension of the pans from the beam be exactly in the same line as the centre of motion; (2) that these points be precisely equidistant from the centre of motion; (3) that the arms be as long as conveniently may be, in relation to their thickness and the weight they are intended to carry, in other words, consistently with

FIG. 15 — Ancient Roman Balance

the stability of the balance; (4) that there be as little friction as possible at the centre of motion and the points of suspension; (5) that the centre of gravity of the beam be placed a little below the centre of motion.

The fulcrum upon which the beam of a balance rests is formed with a steel knife edge, and the two pans at its extremities are hung upon similar knife edges. In ordinary trade balances, these knife edges, are placed in contact with steel bearings having a spherical curve. But in the practical construction of balances of a high degree of sensibility, such as are required for scientific purposes or for the comparison of standards in which very minute differences of weight are to be determined, there are many circumstances to which attention is requisite, that may properly be neglected in balances used for commercial purposes. In such balances of precision great

* Continued from p. 491.

care is required in the adjustment of the knife edges. They are first made quite sharp, and are then slightly rounded with a fine hone or a piece of buff leather. On the regular form of this rounded edge, the excellence of the action of the balance very much depends. The central knife edge rests upon an agate or polished steel plane, whilst the two pans are suspended from agate or steel planes bearing upon the knife edges at the ends of the beam. In order to preserve the nice adjustment of the knife edges, they are never allowed to rest upon their bearings, except when weighings are made. At all other times, the beam and pans are separately supported upon a brass frame attached to the column of the balance, but moveable in a vertical direction upon it. When required to be put in action the support is gradually lowered by means of a lever handle, and the knife edges are brought upon their bearings.

The principal cause of discordances in the results of successive weighings with a balance of precision arises from the risk of the knife-edges not being brought again to exactly the same position on the plane bearings, after the balance has been stopped and again set in action.

The most perfect balance is that which varies least in the points of contact between the knife-edges and their bearings during successive weighings. For the attainment of this very important requirement, the supporting frame is furnished at each of its extremities with two pins terminating in cones and made to fit exactly into corresponding conical holes in the plane bearings, at each of the extremities of the beam. The pins and holes are in a line normal to the axis of the beam. The points of these four cones are all in the same horizontal plane. As the movement of the supporting frame in a well-constructed balance of precision is always in the same vertical line, being guided by a vertical rod fitted to a cylindrically drilled hole in the column of the balance, the knife-edges and their bearings are always brought into contact in the same relative positions. Balances of precision are always enclosed in plate glass cases, with a view both to their preservation, and to keep the balances as far as possible from being affected in their action by draughts of air, alternations of temperature, &c.

As to the theory of the relative positions of the centre of motion and the centre of gravity of a balance, it is to

FIG. 16.—Index Scale, &c., of No. 1 Balance of Standard Department

be remarked, (a) If the fulcrum be placed in the centre of gravity of the beam, and the three edges be all in the same right line, the beam of the balance will have no tendency to one position more than another, but will rest in any position in which it may be placed, whether the pans be suspended to it, or not, and whether the pans be empty or equally loaded. (b) If the centre of gravity of the beam, when level, be immediately above the fulcrum, it will upset with the smallest action; that is to say, the end which is lowest will descend; and it will descend with the greater velocity, according as the centre of gravity is higher, and the points of suspension less loaded. (c) But if the centre of gravity of the beam be immediately below the fulcrum, the beam will not rest in any position but when level; and if disturbed from that level position, it will vibrate, and at last come to rest in a horizontal position. Its vibrations will be quicker, and its tendency to the horizontal position stronger, the lower the centre of gravity, and the less the weight upon the points of suspension.

Again, as to the relative position of the central knife edge, which constitutes the fulcrum of the beam with the line joining the two outer knife edges, which form the points of suspension, it is further to be remarked, (1) If

the fulcrum be below the line joining the points of suspension, and these be loaded, the beam will upset, unless prevented by the weight of the beam tending to produce a horizontal position, as shown in (c). In such case, small weights will form an equipose. In case of (a), a certain exact weight will rest in any position of the beam, and all greater weights will cause the beam to upset, as in (b). (2) If the fulcrum be above the line joining the points of suspension, the beam will come to its horizontal position, unless prevented by its own weight, as in (b). (3) If the centre of gravity be nearly in the fulcrum, all the vibrations of the loaded beam will be made in lines nearly equal, unless the weights be very small, when they will be slower. The higher the fulcrum the quicker will be the vibrations of balances, and the stronger the horizontal tendency.

It is thus evident that the nearer the centre of gravity of the beam is to the centre of motion, the more delicate will be the balance, and the slower the vibrations. The tendency to a horizontal position is therefore increased by lowering the centre of gravity, in which case it will also require a greater additional weight to cause it to turn or incline to any given angle, and it is therefore less sensible with a greater load. The fixing of the centre of

motion in a balance is consequently of peculiar importance, for on this depends the ease with which it will be affected by a smaller weight, and the readiness with which the beam will return to a horizontal position. And it will be seen that the best position of all is that in which the centre of motion is a little above the centre of gravity. Even in this, it should be proportioned to the distance of the weights from the fulcrum, and the amount of the load, which can only be attained in different beams by practice and experience. In order to regulate the centre of gravity in balances of precision, they are made to carry a small weight either over or under the centre of motion, which is moveable by means of a screw.

From what has been said it would appear that if the arms of a balance be unequal, weights which form an equipoise will be unequal in the same proportion. But although for many purposes the equality of the arms of a balance is advantageous, yet a balance with unequal arms will weigh just as accurately as one with equal arms, provided the standard weight itself be first counterpoised, then taken out of the pan, and the weight to be compared be substituted and adjusted against the counterpoise. Or when proportional quantities only are required, they may be weighed against standard weights, taking care always to put these weights in the same pan. But in this case it is indispensable that the relative lengths of the two arms of the balance continue invariable. For this purpose, either the three knife edges should be truly parallel, or the points of suspension and support be always in the same part of the knife-edge.

If the beam of an equal armed balance be adjusted so as to have no tendency to any one position, as in (a), and the pans be equally loaded, then if a small weight be added to one of the pans, the balance will turn, and the point of suspension move with an accelerated motion, similar to that of falling bodies, but very nearly as much slower in proportion as the added weight is less than the whole weight borne by the fulcrum. The stronger the tendency to a horizontal position in a balance, or the quicker its vibrations—see (c) and (2)—the greater additional weight will be required to cause it to turn or increase to any given angle. If a balance were to turn with $\frac{1}{1000}$ part of the weight, it would move at the quickest, 10,000 times slower than a falling body, that is to say, the pan containing the weight, instead of falling through 16 ft in a second of time, would fall only through $\frac{1}{1000}$ part of an inch, consequently all accurate weighing must be slow.

Long beams have been generally recommended because the quantity of motion in a given body varies as its distance from the fulcrum, and therefore the greater the distance, the most distinguishable will be the motion arising from any small difference between the weights compared. On the other hand, there are certain advantages in the quicker angular motion, greater strength, and less weight of a short beam.

The pans of a balance should be suspended in such a manner that in all positions the corresponding cords or rods may be parallel to one another, the weights, though equal, will not be in equilibrium.

In ordinary commercial balances, the preponderance of either pan is indicated by a slender rod attached to the beam immediately over its centre of motion in a line perpendicular to the axis of the beam, and moveable freely between the two forks of the handle. It is called the tongue of the balance, and the degree of preponderance of either pan is shown by the greater or less deviation of the tongue from its normal vertical position. In balances of precision, the index is a longer needle-rod, fixed either in a line perpendicular to the axis of the beam, and below its centre of motion, or in a line in continuation of its axis. In both cases the pointer moves along a graduated index. But an index placed perpendicular to the beam affects its equilibrium when turning from its horizontal position; the momentum of the index

being measured by its weight multiplied with the distance of its centre of gravity from a line perpendicular to the horizon. The error thence arising may, however, be corrected by continuing the index-rod or counterpoising it, on the opposite side of the beam.

The finest balances of the Standards Departments have the index pointer in the line of the axis of the beam, as shown in Fig. 16, which represents the left-hand side of the balance, the right-hand side being similarly furnished with a pointer and index scale.

This is the medium size of six of the finest balances of the Standards Department, constructed by Mr Oertling. For all weighings of standards requiring special accuracy, the highest and lowest points reached by the needle in each oscillation of the balance are read on the index scale through a telescope fixed at about 5 ft distance, by which means each reading can be satisfactorily taken by estimation to one-tenth of a division of the scale.

Another balance of the Standards Department is one constructed by Barrow, and used by Prof. Miller for all his weighings during the construction of the new Standard pound. The knife-edges work upon quartz planes. Index scales marked on a thin and nearly transparent slip of ivory are fixed immediately above each end of the beam and oscillate with it. They are of the following form and size. These scales are illuminated by a candle

FIG. 17.—Index Scale of Barrow's Balance

placed at a little distance either in front of or behind the balance case, a lens being interposed, and they are viewed through compound microscopes having a single horizontal wire fixed in the focus of the eye-piece. The microscopes are fixed to the front of the balance-case, and as the observer must necessarily be close to the microscopes during weighings, a second glass screen is interposed between him and the front of the balance-case, having openings opposite the eye-pieces of the microscopes.

The weight intended to be carried by each of these balances, and the mean value of one division of the index scale, or the weight represented by it, when the balance is fully loaded, may be seen in the following table—

Balance	Length of Beam	To carry in each pan		Mean value of 1 div. of Index Scale
		Avoirdupois	Troy	
No 1	16	56 to 14 lbs., or 500 to 400 oz.		0.15
No 2	24	7 to 2 lbs., or 200 to 20 oz.		0.02
No 3	30	1 lb. to 2 oz. or 16 to 2 oz.		0.0015
No 4	30	1 oz. and under, 1 oz. and under		0.0002
No 5	30	30 gr. and under		0.0002
No 6	30	1 kilo and under		0.0015, or 0.1 mgr.
Barrow's	20	1 kilo and under		0.001, or 0.3 gr.

There is another much larger balance which was originally constructed for weighing the contents of water of the Imperial Standard bushel, the total weight in each pan being nearly 300 lbs. The beam of this balance is of mahogany, 67½ in. in length. With a full load, the mean value of 1 div. of the index-scale is 0.4 grain. This balance, like the other, is enclosed in a large plate-glass case.

In all these balances, the value of a division varies from time to time according to the weight in the pans, the condition of the balance, the state of the atmosphere, &c., and in all very accurate weighings it is desirable to determine the value for each comparison, by an additional weighing, after a very small weight, accurately verified and equal to a few divisions only of the balance, has been added to one of the pans, so that its effect on the reading of the index scale may be noted. The above stated values

indicate nearly those found when the balance is in good working condition, and fairly weighted.

All these balances, when in equilibrium, will turn with a very small additional weight, equal to the value of two or three divisions, placed in one of the pans. They are exceedingly sensitive, for the sensibility of a balance is to be measured by the least amount of additional weight placed in either pan that is sufficient to turn the index-point from its normal position, when the balance is in equilibrium, and by the greatest amount of deviation from the normal position which is produced by a very small difference in the weights.

H. W. CHISHOLM

(To be continued.)

CINCHONA CULTURE.*

FEW subjects have been so frequently before pharmaceutical readers during the past ten or fifteen years as the efforts of the governments of Holland and Great Britain to introduce the various species of Cinchona into their respective colonies. It would be hardly possible to overrate the importance of the enterprise, and it is one that interests alike the pharmacist, the botanist, and the votary of economic science. The records of progress which have been made public are so scattered and unconnected, the opinions and reports so conflicting, that it has been difficult for the general reader to retain the thread of the story or to arrive at any very clear estimate of the present position and prospects of the undertaking. The earliest steps in this great experiment in acclimation date back to a period before that which we have had under review, but so far as results are concerned, the subject is one which pertains essentially to the past few years, and I propose to place before you, in as few words as may be, and uncluttered by the controversial matter with which its literature abounds, an outline of the beginning of the enterprise and of its present practical aspect.

The initiative in Cinchona cultivation was taken, as you well know, by the Dutch Government, whose efforts were directed to its introduction into the Island of Java. The first Cinchona trees which were sent out to that colony were a few specimens of *C. Calisaya*† raised from seeds collected by M. Weddell in Bolivia, and forwarded by a firm of nurserymen in Paris in exchange for rare Javan plants. In the same year, 1852, the Dutch Government were induced to send M. Hasskarl, a gentleman previously attached to the Botanic Gardens at Buitenzorg, on a mission to South America, for the purpose of collecting plants and seeds. During the two years following M. Hasskarl pursued his labours, and succeeded in forwarding consignments from some parts of Peru, the Cinchona districts of Bolivia being for the most part closed against him, and his efforts were supplemented as to the New Granada species by the assistance of Dr. Karsten. The resulting collections were sent in part direct to Java, and the remainder to Amsterdam for re-shipment. I need not dwell on the mishaps and disappointments inevitable in so new and difficult an enterprise—it is sufficient to note that within three or four years, that is by the middle of 1856, upwards of 250 plants, almost exclusively of two species, *C. Pahudana* and *C. Calisaya*, were flourishing in the Java plantation as the outcome of the expedition. In the same year, with wise forethought, an accomplished chemist, Dr. De Vrij, was sent out to conduct chemical observations on the growing barks.

We may pass over the long series of troubles that attended the early efforts of those in charge of the trees,

the ravages of insects, the destruction of young plants by rats, the devastation committed by wild cattle and rhinoceroses, and, above all, the difficulties dependent on climate, which eventually necessitated the transplantation of nearly the whole of the trees from the locality first chosen, on the north side of the mountain range, to one with a southern aspect. We will pass on, I say, to the year 1863, and we shall find that the total number of Cinchona trees in Java was then 1,151,810. Of these about 99 per cent were of the species known as *C. Pahudana*, the remainder comprising about 12,000 of *C. Calisaya* and trilling numbers of four other species. This proportion was unfortunate, for the bark of *C. Pahudana* was found to be deficient in alkaloids, and therefore supposed to be valueless, and by decrees dated 1862 and 1864 its further culture was ordered to be forthwith stopped.

We may now turn to the steps taken by the British Government in the same direction.

Dr. Ainsley, in his work on "Materia Medica," was perhaps the first to suggest the idea of the acclimation of the Cinchona in India, and, as early as 1839, Dr. Forbes Royle especially indicated the Netherly and Sishet mountains as eligible for the experiment. Appeals were subsequently made to the East India Company by Mr. Grant and Dr. Falconar, with the object of inducing them to take up the matter, and in 1852 instructions were sent to the British consuls agnate in South America to endeavour to procure seeds of the various species, but without much real effect. Dr. Royle, as Reporter on the Products of India, continued to urge the subject on the attention of Government up to the time of his death, and eventually, in 1859, at the instance of his successor in office, Dr. Forbes Watson, the services of Mr. Clements R. Markham were called into request by the home authorities.

Mr. Markham proposed a fourfold expedition to South America, and his scheme was at last sanctioned by the Secretary of State for India, and ordered to be carried out. The first portion of the expedition was directed to Bolivia and Carabaya, the region of Cinchona *Calisaya* and *C. micrantha* (var. *Boliviana*). Secondly, Huanuco and Huamale were to be searched for *C. nitida* and *C. glaucofolia*. Thirdly, Cuenca and Loja in the Republic of Ecuador for *C. Chahuaguala*, *C. Urtilingua*, and *C. Condaminia*, and lastly, New Granada as the habitat of *C. patayo* and *C. lucifolia*. Mr. Pritchett and Mr. Spruce were appointed coadjutors to Mr. Markham, and the expeditions set out in 1859, the latter gentleman proceeding to the northern part of Bolivia, the district of the yellow barks; Mr. Spruce to the mountain region of Chimborazo, in quest of red cinchonas; Mr. Pritchett taking the grey bark forests of Huanuco, in the north of Peru. The perils encountered by these travellers, the hardships they endured, the disappointments they suffered, form a chapter in the history of travel. But illness and privation, bad roads, and even native jealousies left unaffected the general success of the expedition, and though, unfortunately, the plants collected at great risk by Mr. Markham, including many of the best species of Bolivia, perished in the Red Sea in their transit to India, leaving no survivors, it is to the work accomplished by these three enthusiastic labourers that we owe the basis of our present Cinchona plantations. In 1860, the Otacmacund station was established, and the following year the number of young Cinchona trees was reported to be 1,128. Under the excellent care of Mr. McIvor these had been increased in 1863, the date to which I have brought my account of the Java plantations, to 248,166.

It is no part of my purpose to enter into minutiae of history, nor to do more than associate with the first steps in Cinchona culture the names of Messrs. Hasskarl and Markham, Spruce, and Pritchett as travellers, those of Dr. De Vrij and Mr. John Eliot Howard as advisers in technical details, and more recently, Messrs. McIvor and

* From the Address delivered at the Pharmaceutical Conference, Bradford, by Henry B. Brady, F.R.S., President.
† Dr. My Inland, J. E. Howard, F.R.S., to whose kind revision subsequent paragraphs owe any scientific value they possess, tells me that, accurate speaking, these were *C. Calisaya*, and var. *Josephiana*.

Broughton, who have been conspicuous, so far as India is concerned, in the rapid development of the enterprise.

The efforts of our own Government have not been confined to India, but localities have been sought in other parts of the world where natural conditions seemed to favour the chance of success in the introduction of quinine-yielding trees, and at the time I speak of (1863) there were under the care of Mr. Thwaites in Ceylon upwards of 20,000 young Cinchona plants. Jamaica also had made a successful beginning, and the authorities of several European countries were considering how far their respective colonies might be utilised to the same end, though but little decided action beyond what I have stated had been taken.

The ten years that have intervened need not detain us, but having noticed the origin, we will turn at once to the practical aspect of the subject at the present time.

The latest official return places the number of Cinchona trees in cultivation in the Island of Java at two millions.

It can find no published account of the exact extent of the British plantations at the present time. My latest information I owe to the kindness of C. F. Markham, F.R.S., of the India Office. It is contained in the Parliamentary Blue-book of August 1870, and refers only to the Madras and Bengal Presidencies. This gives the total number of Cinchona plants growing on the Neilgherries in January of that year at 2,595,176, of which nearly one-half (1,143,844) were permanently planted out.* The number at Darjeeling in the Bengal Presidency in March 1870 is stated at 2,262,210, of which a million and a half were in permanent plantations

Of the extent of the plantations in Ceylon and Jamaica I know nothing, but reports from time to time state that they are prospering. It is needless to refer to the experiments in cultivation in the south of Europe, the Caucasus, Brazil, the Philippines, or Australia, as these are not yet sufficient in extent to have any practical significance.

The relative value of the bird's produced by the various species and varieties of *Cinchona* is a question that has received close attention, and perhaps cannot be considered settled until something more like uniformity in the subdivision and nomenclature of the genus prevails. Plants regarded as merely varieties of the same species yield widely differing proportions of alkaloids, and the subject is further complicated by considerations as to the possible effects of cultivation and of different climatal conditions.

The barks now being produced in the Dutch and British colonies are referrible to five species, viz. —

C. Calisaya, of which, as I have said, only a small proportion realises expectation in its yield of quinine :

C. Hasskarlana (called a hybrid), which appears to be of little value in respect of alkaloids.

C. Pahundiana, deficient in the same particulars, but producing a bark which finds a ready market for pharmaceutical purposes ;

* Since this was written I have received a copy of a return which is believed to represent the actual number of Cinchona trees in the Government plantations in the Neighbors at the present time. It shows an increase of 12,330 "planted out," and is as follows:—

Crown barks (<i>C. officinalis</i>)	508,878
Red barks	579,938
Yellow barks	33,850
Grey barks	28,759
Other species	4,749
				<hr/> 1,196,174

In addition to these it must be recollected that the Government had up to 1870 distributed upwards of 178,000 trees from the Neigherry nurseries, and still is nearly three hundred ounces of the seed of various species, to private individuals distributed to plant on their estates. After all, when the experimental stage of such an undertaking is over, private enterprise would be the best way to effect it. A Parliamentary power, like the progress of the Bill in 1870, is just issued, gives the total number of plants in the Neigherry plantations as 2,639,285, but this probably includes the very young trees still in the nurseries. I have no particulars beyond what appears in a paragraph in the *Times*.

C. officinalis, which, in British India,* appears to be the most generally satisfactory : and

C. succirubra, which, notwithstanding certain exceptional samples, has not turned out altogether well. . . .

I can say little about the West Indian plantations as to extent, but the quality of the bark they produce is encouraging. Mr. Howard reports that the chemical examination of barks from Jamaica is "highly satisfactory as regards the prospects of Cinchona culture in that island."

Various questions are still pending:—the influence of manures on the chemical constituents of the trees, the various methods of removing the bark from the tree, and the encouragement of renewal by the processes of stripping and mossing, and many others of like importance, the solution of which must be left to time, and need not occupy our consideration here.

DONATI

SCIENCE, and more particularly astronomy, has recently sustained a serious loss in the death of Prof. G. B. Donati, Director of the Royal Observatory of Arcetri, near Florence, and Professor of Astronomy in the Royal Institution of that city.

On his return from Vienna, where he had represented Italy at the International Meteorological Congress, he was seized by a severe attack of Asiatic cholera, to which in a very short time he fell a victim, dying at his villa near the Observatory, on the morning of the 20th of September last, being only forty-seven years of age. He was born at Pisa in 1826. In 1852 he began his astronomical career at the Observatory of Florence, and by his talents, his attainments, and his indefatigable industry, rapidly gained the esteem and admiration of the learned, attaining a well-merited fame, not so much by the discovery of new comets—among which the most remarkable was that of 1858, to which he bequeathed his name—as by the important observations which he made and published. Of these we need only mention his observations on the study of the spectra of the stars, by which work he successfully inaugurated in 1860 one of the most important branches of physical astronomy, namely, the spectroscopy of celestial bodies.

In 1864 he succeeded Prof. G. B. Arna as Director of the Observatory, after which much of his time and energy were devoted to the establishment of an observatory for Florence and for Italy, which should be completely adapted to the present exigencies of Science, both as regards astronomy and terrestrial physics.

He was in no way discouraged by the serious difficulties of this undertaking, but, inspired by a true love of Science, he overcame them all, inasmuch that in a short time, under his active and keen-sighted superintendence, the new observatory was erected on the hill of Arcetri, an observatory which, by the excellence of its position, as well as by the convenience and solidity of its construction, has guaranteed for astronomy and terrestrial physics the most important advantages in every branch of observation.

The observatory was already in working condition, and an important series of observations had been commenced when Science was robbed, by a premature death, of one of her most valued worshippers, who was thus cruelly cut off just as he had entered upon a brilliant career, in which, had he lived, he would certainly have greatly augmented his fame, and shed glory on the Observatory of Arcetri.

Prof. Donati had already commenced a series of notes from the new observatory by the recent publication of

* This limitation is at present necessary. Dr De Vrij's late paper on Jamaica barks ("Pharm. Journal," August 16, 1873) shows the produce of *C. officinalis* in that island to be very deficient in quinine, inferior indeed to *C. Pahudiana*, whilst a still later communication confirms Mr. Howard's opinion as to the richness of Indian-grown specimens.

some most careful observations of his own on the luminous phenomena of the great Polar aurora of the 4th to the 5th of February, 1872; and we had hoped that other important observations by the illustrious Italian astronomer would, to the great advantage of Science, have been published in the future Notes issued from that scientific establishment.

NOTES

WE regret to have to record the death of two notable men this week. The one is Sir Henry Holland, Bart, M.D., F.R.S., &c., who died on Tuesday, the 28th inst., at the age of 85 years. Sir Henry had caught cold on returning from Paris, which, in spite of his wonderfully robust constitution, proved too much for the veteran traveller. The other is Mr. Albany Hancock, the distinguished anatomist, who died on the 24th inst. He was a medallist of the Royal Society, though not a Fellow. We hope shortly to give memoirs of both men.

SIR ROBERT MACIURE, C.B., so well known in connection with Arctic discovery, died on the 17th inst., at the age of 66.

SIR SAMUEL BAKER was announced to appear before the Geographical Society on Monday first, and give an account of the geography of the country he has lately visited, but we regret very much to hear that illness will prevent him from fulfilling this and other engagements. He has been suffering from inflammation of the lungs.

PROF. FLOWER, we regret to hear, has been compelled to spend the winter in Egypt on account of the state of his health.

DR. J. EMERSON RYMONDS has been elected Professor of Chemistry to the Royal College of Surgeons in Ireland. The College of Surgeons is to be congratulated on this appointment. Dr. Reynolds will, we believe, still hold his appointment of Keeper of the Minerals and Professor of Analytical Chemistry to the Royal Dublin Society.

MR. JOHN STUART MILL has left his herbarium of European plants to Kew.

WE are informed that the authorities of the Jardin des Plantes, of Paris, have secured the valuable collection of books on Natural History belonging to the late M. J. Verreaux, and also his private collection of Sugar birds (*Nectarinidae*), which includes many unique specimens.

IN connection with St. John's College, Cambridge, there will be offered for competition an Exhibition of 50*l*. per annum for proficiency in Natural Science, the Exhibition to be tenable for three years in case the exhibitor have passed within two years the previous examination as required for candidates for honours; otherwise the exhibition to cease at the end of two years. The candidates for the Natural Science Exhibition will have a special examination (commencing on Friday, December 12, at 9 A.M.) in (1) Chemistry, including practical work in the Laboratory (2) Physics, viz., Electricity, Heat, Light (3) Physiology. They will also have the opportunity of being examined in one or more of the following subjects, (4) Geology, (5) Anatomy, (6) Botany, provided they give notice of the subjects in which they wish to be examined four weeks prior to the examination. No candidate will be examined in more than three of these six subjects, whereof one at least must be chosen from the former group. It is the wish of the Master and Seniors that excellence in some single department should be specially regarded by the candidates. They may also, if they think fit, offer themselves for examination in any of the Classical or Mathematical subjects. Candidates must send their names to one of the tutors fourteen

days before the commencement of the Examination. The tutors are Rev. S. Parkinson, D.D., Rev. T. G. Bomey, B.D., and J. E. Sandys, Esq., M.A.

THE Royal Horticultural Society of Tuscany has announced an International Horticultural Exhibition to be held at Florence from May 17 to 25, 1874, and has also issued the programme of an International Botanical Congress to be held on three days during the Exhibition. A very large number of prizes, including 100 gold medals, are offered for collections of plants or single plants, which are included in 248 different classes, and among other objects for which prizes may be obtained are bouquets, botanical drawings, models, garden tools and ornaments, garden structures, manures, herbana, specimens of timbers, &c. The Congress will be opened by the president, Prof. Parlatore; excursions to the neighbourhood of Florence and the principal gardens will be inaugurated, &c., and among the subjects proposed for discussion, *inter alia*, are the following—On the duration of dormant vitality in plants, and on the means of restoring it; on the causes of the movements in leaves, on the acclimatisation of perennial plants, on the analogy between the reproductive organs of flowering and (so-called) flowerless plants; on the general occurrence, or otherwise, of cross-fertilisation, and on the durability of the vitality of pollen, on the nature and functions of the gonidia of lichens on the nature and origin of bacteria; on the possibility of establishing rules for a rational distinction between the groups called species, race, variety, &c.; on the value to be set on the determination of fossil plants, &c.; on the character and origin of Alpine flora, and especially on the causes which have limited their extension. The Horticultural Society of Tuscany seem determined to do everything they can to attract visitors, who must send their names to the president or secretary at the Musée Royale de Physique et d'Histoire Naturelle at Florence, and altogether botanists and horticulturists seem likely to have a good time of it.

AN effectual remedy for the devastations committed on the vines by the *Phylloxera vastatrix* is said to have been discovered by MM. Monestier, Lautaud, and D'Ortoman, of Montpellier. It consists in placing in the ground, close to the root of the infected plant, an uncorked tube containing about 2 oz. of bisulphide of carbon. The vapour from the bisulphide in a short time permeates the whole of the ground about the root; the vapour is not, like the liquid itself, injurious to the plant, but is immediately fatal to the insect. Care must be taken not to spill any of the liquid on the roots of the vine.

THE following subjects for prizes to be awarded in 1874 have been proposed by the Batavian Society of Experimental Philosophy.—1. To discover if there exists in the molecular state of bodies, modifications other than those caused by temperature, which are such as to give for the same body, different spectra. The Society wishes that this inquiry should bear chiefly on the magnetic condition of bodies. 2. To find out by new experiments if the vapour of water exercises on radiant heat an alternating effect much more powerful than dry atmospheric air as Mr. Tyndall maintains, or if there exists no difference in this respect between dry and moist air, as M. Magnus maintains. The Society desires that the new experiments which it asks for be conclusive and enable it to decide between the two opinions. 3. To determine what influence the pressure which is put upon an electrolyte has on electrolysis, and how far in this case is the principle of conservation of energy confirmed. It is wished that this inquiry bear on three liquids at least, to be chosen by the competitor. 4. To determine the resistance of the liquid amalgams of zinc and gold to the galvanic current. Six at least of each of these amalgams, in various proportions, ought to be examined. 5. A prize is proposed for new experiments which will enable a

certain decision to be come to on the opinion advanced by M. Gauguin as probable, viz. that voltaic electricity is propagated by matter, while induced electricity is propagated by ether.

THE German expedition for the exploration of the Libyan desert is expected to start from Europe about the end of November, and from Egypt early in December, and it is thought that the first reports may accordingly be looked forward to about Christmas. The leader of the expedition is Dr. Gerhard Rohlfs.

FATHER SECCHI, we are glad to see, has received permission from the Italian Government and Cardinal Antonelli to remain at the Royal College of Astronomy.

AMONG the societies concerning which we have received information since the publication of our list last week, is the Working Men's College Field Club, of which Prof. Flower is president. It meets in the Museum of the College in Great Ormond Street, has been in existence only five months, but appears from a reports before us to be in good working trim. It has meetings at which papers are read, courses of lectures by well-known scientific men, and several field-days each month. These field days seem generally to be Saturday and Sunday, and we only wish that working-men generally put their Saturdays and Sundays to such an excellent recreative use.

WE congratulate the Sunday Lecture Society on the excellent beginning, to be made next Sunday, of their winter course of lectures. Dr. Carpenter, we see, is to give a series of two lectures on the brain, and we think the society ought to consider whether it would not be advisable to have more connected series of lectures than they have hitherto had.

IN a final letter to yesterday's *Daily Telegraph*, Mr. George Smith concludes the account of his Assyrian Expedition. Altogether both Mr. Smith and the *Telegraph* are to be congratulated on the results of the enterprise.

THE following "Science Lectures for the People," are announced to be delivered at the Memorial Hall, Manchester, the Hulme Town Hall being now required for other purposes—Wednesday, Oct. 29, "Polarised Light," illustrated by experiments in the electric light, by Wm. Spottiswoode, F.R.S., Treasurer of the Royal Society. Nov. 5, "How Flowers are Fertilised," by A. W. Bennett, M.A., Lecturer on Botany, St. Thomas's Hospital, London. Nov. 12, "On Parasites and their Strange Uses," profusely illustrated, by T. Spencer Cobbold, M.D., F.R.S. Nov. 26, "Animal Mechanics," illustrated by experiments with the electric light and the oxy-hydrogen lantern, by S. M. Bradley, F.R.C.S. Dec. 3 "The Senses," by Prof. Croom Robertson. Dec. 10, "On Muscle and Nerve," illustrated by experiments with the electric light and the oxy hydrogen lantern, by Prof. Gamgee, F.R.S. Dec. 17, "The Time that has elapsed since the Era of the Cave Men of Devonshire," by Wm. Pengelly, F.R.S.

THE French Association, as is known, is to meet at Lille in 1874. Among the many towns which desire to be favoured with its presence in 1875 is Nantes, the Municipal Council of which has already devoted 10,000 francs to defray the preliminary expenses of the session, should it take place there.

ACCORDING to *La Nature* the volcano of Mauna Loa, in Hawaii, is at present in full eruption.

A MICROSCOPIC SOCIETY has recently been founded at Melbourne.

LAST Thursday the whaler *Erik* arrived in Dundee, having on board R. W. D. Bryan, who was astronomer to the *Polaris* Expedition; B. Manch, seaman, and J. W. Booth, fireman. All

the men were in excellent health. On Friday the *Ravenmuir* arrived at Dundee, having on board one of the boats ingeniously constructed by Mr. Chester, in which the castaways effected their escape from their winter quarters. It is about the size of a whaling-boat, and somewhat similarly shaped.

THE *Journal of the Society of Arts* gives, from the annual report published by the Minister of Public Education, the following particulars respecting education in Italy during the scholastic year 1872-73:—The number of students registered at the Royal Universities was 5,614, and in addition to this number 1,333 persons were allowed to attend the course of lectures, making in all 6,497. At the Universities of Cambrino, Ferrara, Perraugia, Urbino, 284 students and 22 non-students, in all 806, attended the course of lectures. At the Royal Institute of high studies at Florence the number of students was 214. The Literary and Scientific Academy of Milan numbered 26. At the Royal School of Application for Engineers the number of students was 173, and at that at Naples 185. The Technical Institute of Milan was attended by 209 students, and the Normal School of Pisa by 41. 295 students were registered at the schools of Veterinary Science of Milan, Turin, and Naples. The royal lyceums are 79 in number, with 4,228 pupils, the royal gymnasiums 104, with 8,462 pupils. In the royal colleges, which are 26 in number, there were 2,208 pupils. The following schools received subsidies from Government—32 in Piedmont, 67,290 francs, 19 in Lombardy, 49,810 fr., 10 in Venetian provinces, 16,550 fr.; 24 in Emilia, 52,800 fr.; 14 in Tuscany, 31,200 fr.; 17 in Marshes, Umbria, and Roman provinces, 20,800 fr.; 54 in Neapolitan provinces, 90,350 fr.; 5 in Sicily, 6,200 fr. The number of elementary schools throughout the kingdom was 41,713 (being 3,413 more than were opened during the previous year). Of this number 21,353 were for boys, and 16,280 for girls. 33,556 were public and 8,157 private schools. The number of pupils attending those schools during the scholastic year 1872-73 was 1,723,007, showing an increase of 145,853 on the number of the previous year; of this 960,517 were boys, and 762,490 girls. The total number of pupils attending the public schools was 1,545,820, and those of the private schools 177,187. The total number of teachers in these schools was 43,420, being an increase of 3,102 on the number of the previous year. Of these 23,212 were teachers in the boys' schools, and 20,211 in the girls' schools; the public schools being conducted by 34,309 teachers, and the private by 9,114.

WE have received the Catalogue of the publications of Gauthier-Villars, of Paris, for April, May, and June of this year. It contains the publications of most of the scientific societies of France, beside a number of original works in mathematics, physics, engineering, &c., which recommend it to the attention of scientific men. A few more foreign catalogues have also come to hand, which we would recommend to those who wish to know what is being published on the Continent; no doubt the publishers would be glad to send these catalogues to any one asking for them.—Catalog des Antiquar. Bucherlagers von Fideles Butsch Sohn (Augsburg, 1874, &c.), a catalogue of works in Anatomy and Physiology, and Medicine generally, which belonged to the late Dr. Fahlé, of Altona (T. O. Weigel, Leipzig), the same bookseller has sent a Catalogue of standard works in all departments of Science.

WE are glad to see that the *Quarterly Journal of Education*, which is shortly to become a monthly, has opened its columns to a correspondence upon questions relating to science-teaching.

WE have received a separate reprint from the "Proceedings of the Geologists' Association" of Mr. D. C. Davies' valuable paper on "The Overlapping of the Several Geological Formations of the North Wales Border."

THE United States Signal Service has recently constructed a telegraph line to the summit of Pike's Peak, in Colorado, which is said to be the highest point reached by any line in the United States, or perhaps in the world. The height is said to exceed 11,000 ft. Regular reports as to the weather are to be sent to Washington three times daily.

THE additions to the Zoological Society's Gardens during the past week include an American Cross Fox (*Canus fulvus*), a Golden Eagle (*Aquila Chrysaetus*), and a Virginian Eagle Owl (*Bubo virginianus*), from North America, presented by Capt. D. Herd; a Mexican Deer (*Cervus mexicanus*), from Porto Rico, presented by Mr. W. Isaacson, two Sand Badgers (*Mela an-huma*), from Japan, presented by Lieut. Hon. A. C. Littleton, a Black-eared Marmoset, (*Leopole penicillata*), from Brazil, presented by Mr. C. H. Hawshaw; a Spotted Hyena (*Hyena ex oculis*), and two Bronze-winged Pigeons (*Phaps chalcoptera*), born in the Gardens, and two Rheas (*Rhea americana*), from S. America, deposited; two Chilian Tinamous (*Rhynchotus peruvianus*), three Banded Tinamous (*Crypturus noctuans*), and two Olsote Tinamous (*C. olsotus*), from S. America, received in exchange

ORIGINAL RESEARCH AS A MEANS OF EDUCATION*

II.

IT is the greatest possible mistake to suppose—as, unfortunately, many yet do—that a scientific education unfits a man for the pursuits of ordinary professional or commercial life. I believe that no one can be unfitted for business life or occupations by the study of phenomena, all of which are based upon law, the knowledge of which can only be obtained by the exercise of exact habits of thought, and patient and laborious effort. I dare say many who have had a scientific education make bad men of business, but so do many who have not had such an education; it is not the scientific education which has spoiled them. Even more directly does the value of scientific education bear upon professional and manufacturing life. The medical man's success depends mainly upon the exercise of faculties which are pre-eminently called forth, and strengthened in original scientific investigations. The manufacturer who aspires to something more than following the rule-of-thumb work of his predecessors, requires exactly these habits of mind which are developed by original research. If the brewer, the calico-printer, the dyer, the alkali-maker, the metallurgist wish to make any advance of their own in their respective trades, they cannot do so without the exercise of powers which can only be gained by the prosecution of original inquiry. Doubtless many—nay, even most—of the great discoveries and improvements in the arts and manufactures may have been made by men who have been self-taught. But these men have acquired for themselves, by slow and difficult steps, the same habits of exact observation, patient and laborious devotion, and manipulative or constructive skill which the modern student of science may, at any rate to a very considerable extent, gain in his college course. So valuable is this kind of education found to be, that in Germany, where it is most practiced, the chemical manufacturers now refuse to take young men into their works unless they have not merely had a scientific education, but also have prosecuted original investigation.

If, then, education in its widest sense lies for its objects, as I presume will be generally allowed, the training of the mind and faculties in such a way as most fully to qualify the possessor to discharge with benefit to mankind his duties in after life, surely plans for the encouragement of original scientific research should form no inconsiderable portion of the work of every institution professing to deal with the higher education of the country. And yet when we come to look at the provision made for encouraging original research, either at our older or at most of the more modern seats of learning, we are astonished to find that this essential provision is almost altogether ignored. At Oxford and Cambridge thousands of pounds are each year lavished upon the encouragement of classical and mathematical attainments, whilst the claims of original research can scarcely be said to be recognised. Hence these highly endowed universities, whilst they are justly celebrated for their critical faculties, have ceased

to represent, in any one direction, the productive power of the country.

Original research, the true life-breath of civilisation, does not in England, as is the case in Germany, look to the universities as the nurseries where its young shoots shall be tended and cherished, for there, at present, its value is scarcely recognised. Indeed, Sir William Thompson has expressed his opinion that the system of examinations at the universities has a tendency to repress original inquiry, and exerts a very injurious effect in obstructing the progress of science. The time is, however, not far distant when this want of appreciation of the value of original research will be a thing of the past, and when the universities will vie with each other in encouraging this mainspring of progress, and in honouring more those whose lives are devoted to this high calling. Owing to the want of means of promoting original investigation in our great seats of learning, the scientific activity of the country has found vent through other channels. No want of encouragement can repress really great minds or powerful wills. Manchester can boast the names of many men who, in spite of want of university aid, have done much for science. Who, for instance, in the whole scientific annals of Oxford, can be placed on a footing of equality with Dalton or Joule? These men are, however, great in spite of our systematic negligence of the subjects, the mastery over which has made their names immortal.

If, in the face of so much that is discouraging in this want of recognition of science, England has still no reason to fear the comparison of her great men of science with those of other countries, we may feel sure that our position among the nations will be raised when the Government, our universities, and the country at large become alive to their duties as regards the encouragement of original scientific research, and when the number of able men who devote themselves to this pursuit shall thereby be largely increased. Much assistance in this direction may confidently be expected from the Royal Commission on Scientific Instruction and the Advancement of Science, of which his Grace our President is chairman, and which has lately published its third report on the progress of scientific education and research in the two old universities. In this report, the importance, from a national point of view, as well as an educational instrument of original research is fully recognised, whilst the means of enabling the universities to take their due share in the management of this branch, but this activity is suggested in the evidence given before this Commission by Sir Benjamin Brodie, Prof. Frankland, Dr. Carpenter, and other competent authorities, is of the most decided and unambiguous character, and the opinion thus strongly expressed must ere long produce its effect.

The importance of fostering scientific research in connection with higher education is, however, now well understood to the authorities of this college. Very considerable facilities for carrying out original work are given both to the teachers and to the pupils, whilst in the appointment of the professors special weight is always laid on their power of conducting scientific research. In my department, which has now been organised for many years, I make bold to say that we have not been behind any chemical laboratory in this kingdom in the original work we have produced. The physical laboratory, which has only recently been inaugurated, has already, under the care of its talented Director, whose original researches are valued wherever Science is appreciated, done valuable work, and the new department of practical physiology which has just been established will doubtless soon bear fruit of a similar character. In the biological sciences our teaching resources have hitherto been limited, but although this has necessarily prevented the prosecution of research by the students, the professors of this department have long been distinguished for original investigation in their special branches.

To assist in developing in the practical community the appreciation of scientific research, and owing to the liberality of Manchester men and to the wise advice of Prof. Frankland, who then occupied the chair which I have now the honour to hold, a scholarship for original chemical research—our Dalton Chemical Scholarship—was founded in 1853 as a testimonial, and a fitter one could not have been proposed, to our great townsman. The establishment in England of a scholarship for excellence in original research was, twenty years ago, a circumstance without a parallel, but in spite of the novelty of the experiment, time has fully proved the wisdom of the course which its originators adopted. We can already point to a fairly long list of men who have taken our Dalton Scholarship, who now hold high and

responsible positions in scientific, manufacturing, and official life; and these men will all acknowledge the benefit conferred upon them by the training they received when competing for the scholarship, and whilst occupied for the first time in their lives in carrying out an investigation on some original subject.

On the model of our Dalton Chemical Scholarship, an important physiological scholarship has lately been founded in this College by Mr. Robert Platt; the conditions of tenure involve the prosecution of an original investigation in physiology; and it is to be hoped that the expenditure of this scholarship will do as much to stimulate the study of physiology amongst us as the Dalton has certainly done in the case of chemistry. The establishment of similar scholarships in the branches of physics and biology is much to be desired, and benefactions made for these special purposes will assuredly prove of the greatest value.

It is unnecessary for me to point out the direct applications which the knowledge and experience gained in the laboratory receive in the arts and manufactures dependent upon chemical science. These everyone can see for himself. The ordinary routine work of the alkali maker, the dyer, the brewer, the calico printer, calls immediately for chemical knowledge, and manufacturers who do not yet see the value of the training afforded by original experimental investigation, are ready enough to appreciate chemical knowledge if it can show them that their drags are adulterated or their water impure.

Concerning the exact mode by which encouragement should be given in this country to original research, opinions may differ. One proposal has lately been made by the distinguished president of the British Association (Prof. A. W. Williamson), in his able address at Bradford, which it behoves all interested in the progress of the country carefully to consider. Without attempting to discuss the details of this or other schemes, it may be well to point out those general features of the subject upon which these proposals are based.

In the first place, then, we shall agree that the measures which have to be taken must be systematic, must apply to the country at large, and must include all classes. The need is the development of the latent intellectual resources of the country as regards science, the means of sifting out from the great mass of the people those golden grains of genius which now too often are lost amongst the sands of mediocrity. This can only be fully accomplished by a system extending from the lowest primary schools up to the highest educational establishments in the land, and therefore almost necessitates the action of Government. But whilst believing that a national system is needed in order that the potential scientific energy of the country shall become active, I for one should most strongly object to the establishment of a complete system of State education. One of our greatest safeguards and sources of national strength has been and is the freedom from Government control which our educational municipal, and local institutions have always enjoyed, and the evils of a uniform State system as existing in France (which is such that the Minister for Education remarked with pride, that at a given moment the classes in all the Lycées in France were engaged in reading the same chapter in Cæsar's Commentaries) need only be felt to be deplored.

Secondly, it is clear that in order to be able to select from amongst the people those whose mental and physical powers fit them for ultimately advancing science themselves, the rudiments of a scientific training must be much more widely diffused than is at present the case. This can only be slowly accomplished; the methods of teaching science are only beginning to be understood, and, unfortunately, in school teaching the introduction of a scientific subject has too often been looked upon more as an amusement than as a study requiring as much or more attention and exactitude than the older subjects, one which when properly taught acts to quite as great an extent as a mental discipline. Science teachers have yet to be trained, and a system of introducing elementary science as disciplinary teaching into primary and secondary schools has yet to be made general. At the same time new institutions have to be founded in which the higher branches of the various sciences are taught and original research encouraged, and into which youths of conspicuous merit must be drafted, whilst existing colleges and universities have to be modified to suit the requirements of the time. These institutions must contain laboratories, not only for teaching purposes, but suited for scientific research, and the professors must take in a certain number of advanced students to work on original investigation. This is indeed, as Sir Benjamin Brodie points out in his evidence before the commission, an educational

function of the most important character; because here scientific education is carried out to its end, and if this is not done, you stop short of the most important part of all in scientific education, for the perfection of science as a means of education is seen only in scientific inquiry. The pupils thus trained eventually pursue science as their main business in life, and become in their time teachers and professors of their subject. Thus by degrees the profession of the investigating teacher will become recognised as one in which the ablest of our youths may obtain reward and recognition, as well as satisfaction and delight, and thus the scientific power of the country will be vastly increased.

Concerning the ennobling nature of original scientific inquiry it is needless for me to say much, for although I should be the last to contend that men of science are free from the foibles and weakness common to all mankind, I think it stands to reason that the habits of mind which an investigator must cherish, are such as must raise him above the petty struggles of ordinary existence, and must, for a time at least, lift him into an atmosphere free from the cloud and smoke which too often darken the usual current of men's lives. In order to give you an idea in what original research consists, and to point out to you the interests attaching to an inquiry, the practical applications of which seem as far distant as those of a newly-discovered planet, I will for a few moments draw your attention to a case of the kind with which I happen to be familiar. Amongst the sixty-three different elements of which the earth, so far as we know, is made up, there are many which have been found only in the most minute quantity. Indeed, in the list of elements suspended on the wall, you will notice that a large number out of the sixty-three are marked as rare. A few only of these substances are employed in the arts and manufactures, or are known to play any part in the economy of nature; the rest are rarities of interest at present only to the scientific chemist. It would, however, be presumptuous on our part were we to assume that the existence of these bodies is a matter of no moment, for we are constantly learning that substances hitherto supposed to be useless are of the most vital importance. Hence it is obviously our duty to get to know all we can about the properties of each, even the rarest, of these elementary bodies, and especially about their relation to, and mode of action on, the other elements. It is clear, too, that as long as our knowledge of the properties of any one of these elementary bodies is inaccurate, or if mistaken views regarding any one have arisen, our science must suffer in completeness. For just as an error made in the basement of a house throws the upper storeys wrong, so a mistake concerning the size and shape of the foundation blocks of our science may render the whole chemical superstructure faulty.

In 1830 the great Berzelius fully examined a new elementary body termed vanadium, the existence of which had been previously discovered by his countryman Selstrom. Having most carefully ascertained the remarkable properties of this new substance and its compounds with the other elements, Berzelius gave to vanadium and its compounds a certain chemical position and place amongst the other elements. Thus to the compound of vanadium and oxygen containing the largest proportion of the latter element, and called vanadic acid, he assigned the formula V_2O_5 , meaning thereby, in the atomic language of our great townsman Dalton, that two indivisible particles or atoms of the metal are combined with three indivisible particles or atoms of oxygen, and these views, enforced by experiments of the most unimpeachable character, were for years universally adopted by chemists.

In 1858 a fact was observed by the German chemist, Rammelsberg, with regard to the crystalline form of the best known mineral containing vanadium which exhibited Berzelius's conclusions in a new light. It had long been known that substances which have an analogous chemical composition are found to crystallise in an identical form. Thus the different alums containing alumina, oxide of iron, oxide of chromium, oxide of manganese, all crystallise in octahedra, and the oxides contained in these alums have all an analogous composition, that is, the relations between the number of atoms of metal and of oxygen in each case is identical. Now, Rammelsberg found that the crystalline form of a mineral contained vanadic acid, and lead was identical with another mineral containing phosphoric acid and lead. Hence we should expect to find that the oxide of vanadium, termed vanadic acid, and the oxide of phosphorus, called phosphoric acid, possess an analogous chemical constitution. Such, however, was found not to be the case. Phosphoric acid is well

known, and, without doubt, consists of two atoms of phosphorus, united with five atoms of oxygen, whereas Berzelius only found three atoms of oxygen to two of the rare metal in vanadic acid. How is this discrepancy to be explained? We have here to do either with an exception to the otherwise general law of isomorphism, so that we may have identity of crystalline form, without any analogy in chemical composition, or Berzelius's experiments and conclusions respecting the constitution of this vanadic acid are incorrect. By experiments on the properties of vanadium and its compounds, made with much larger quantities than it fell to the lot of the Swedish chemist to work with, it was shown that something had been overlooked by him. It was proved that the substance which he supposed to be a metal was not a metal at all, but an oxide, and that vanadic acid really contains more oxygen than he believed it to contain. And what is remarkable is that this quantity of oxygen, which had been overlooked, is exactly the quantity which is needed in order to make the constitution of vanadic acid identical with that of phosphoric acid. We have to take out of each atom of Berzelius's metal one atom of oxygen in order to get the true vanadium, so that the real atomic weight of this element is less than that given to it by Berzelius by the atomic weight of oxygen, $67.3 - 16 = 51.3$. Thus the chemical constitutions of phosphoric and of vanadic acids are represented by the formulae P_2O_5 , V_2O_5 . The law of isomorphism remains unassailed, and the goddess (Vanadis is a cognomen of the Scandinavian goddess Freia) who was found wandering as a waif and a stray amongst her companion elements, has been restored to her natural friends, and now forms a recognised member of a family group.

To sum up, my aim in the foregoing remarks has been to show that if freedom of inquiry, independence of thought, disinterested and steadfast labour, habits of exact and 'truthful observation, and of clear perception, are things to be desired as tending to the higher intellectual development of mankind, then original research ought to be encouraged as one of the most valuable means of education. And that on this ground alone, and independent of the enormous material benefits which such studies confer on the nation, it is the bounden duty not only of the Government, but of every educational establishment, and of every citizen of this country who has the progress of humanity at heart, to promote and stimulate the growth of original research amongst us.

HELVETIC SOCIETY OF NATURAL SCIENCES

THE fifty-sixth annual meeting of this society was held on the 18th, 19th, and 20th of August last, at Schaffhouse, under the presidency of Dr. Stürler, and is described as having been a highly animated one. We shall note a few of the more important papers presented; for particulars of which we are indebted to the *Archiv für die Naturwissenschaften*.

In the section of Physics and Chemistry, M. Soret described a method for studying ultra-violet spectra. It consists in placing a thin fluorescent lamina (sulphate of quinine, $\frac{1}{2}$ g. between two glass plates) before the eyepiece of a spectroscopic, where the image is formed, and observing, with sufficient inclination of the eyepiece, the image of the ultra-violet spectrum then developed on the lamina. Prof. Kopp read a paper on breniline and its derivatives. The Deacon process of manufacturing chlorine was the subject of a paper by M. Hutter, which gave rise to lively discussion. Dr. Heim, who has been observing the sounds of cascades, find they all give the note C sharp, or F.

In Geology, Dr. Schlich had a paper on the volcanic rocks of Hochgau. These are in two groups, that of basalts, and that of phonolites. They form isolated cones surrounded with thick deposits of volcanic tufa, the nature and arrangement of which indicate that the eruptions happened at successive intervals about the end of the tertiary epoch. M. Favre showed a section of the Vaudais Alps made at Plénaid, near Vevay aux Ormonts; in which he distinguishes three zones, consisting of superior Jurassic and Neocomian, and different portions of Eocene strata. Dr. Heim exhibited a new method of geological representation of a country, it consists in a series of sections, on the same scale, coloured and fixed vertically at equal distances on a geological map. He also made some observations on the zone of contact of crystalline rocks and sedimentary strata in Eastern Switzerland and the Bernese Alps. M. Lang announced the early publication, by the Alpine Club of a glacier-register, in which information will be given as to dimensions, form progress, &c., of glaciers. At the

first general *séance* Prof. Heim gave a valuable *résumé* of the various theories of glacial motion. At the second, Prof. Desor presented a memoir on *moraines* landscapes, by which he denotes those indicating a former extension of glaciers. The most striking types are at the southern base of the Alps. There is discernible a zone consisting of a succession of verdant hillocks, sometimes aligned, sometimes separate, these are found to be composed of the *débris* of old formations bruised and triturated, and clearly indicating glacial action. A good example occurs at the base of Monte Campo di Fiori.

At the general opening *séance* Prof. Forel gave an account of his researches on the deep-water fauna in Lake Léman, of which he enumerates some thirty species. He had also studied the fauna of the lakes of Neuchâtel, Zurich, and Constance. His conclusions are briefly these:—There are in the lakes three distinct faunas: (a) a littoral, extending to 15 or 20 metres depth, (b) a deep fauna, from 20 to 300 metres, and (c) a pelagic fauna. All the forms of the deep fauna have analogous or similar forms in the littoral fauna, but the converse does not hold. At the same level the deep fauna are the same. A few species found between 30 and 100 metres are not found at 300 metres, but all the types at 300 metres are found between 30 and 100 metres. There are local and seasonal differences. The deep fauna are best studied between 30 and 60 metres. In comparing different lakes the general characters of deep fauna are the same, but special characters vary.

In the section of zoology and botany, M. Bagnon described some sensitive organs found in the epidermis of Proteus and Axolotl. They are considerably developed in the former (1450 were counted in one specimen), and are disposed in linear groups of three or four along certain nerves of the head, and the lateral nerve to the end of the tail. They resemble the cyathiform organs discovered by M. Leydig in 1850, in the epidermis of fishes. Dr. Cartier gave a paper on the sensitive hairs of crocodiles.

In the medical department Prof. Karsten, of Vienna, made a communication on *neoobosis* in which he pointed out that Bacteria, Vibriones, and micro-coccus, &c., are not to be regarded as organic species, properly so called, the phenomena of animal reproduction have never been observed in them. They are pathogenic products, which grow in the interior of vegetable or animal cells, but which do not penetrate there when once developed, to parasites.

In the department of Pure Mathematics the principal paper was by Prof. Schwarz on a new example of a continual function which does not admit of derivatives. This paper will be found in *volume in the Archiv* .

This is the third time in its history that the Helvetic Society has met at Schaffhouse, the former occasions having been in 1825 and 1847. The next annual session is to be held at Coire.

SCIENTIFIC SERIALS

Sitzungsberichte der Königl. Bohemischen Gesellschaft der Wissenschaften in Prag. Jan 1871 to June 1872. (3 numbers.)

Among the more valuable material in these numbers may be noted some contributions to palaeontological botany, more especially a paper by M. Feustmantel describing the various fruit forms met with in Bohemian coal formations. (As published separately, the paper contains several excellent plates). The same author communicates also full accounts of the flora in coal-measures at the foot of the Riesengebirge, and at Merkin.

M. Dvorak describes some curious experiments on individual differences between the two eyes, and between different parts of the retina of the same eye. He shows that two non-simultaneous impressions, each affecting one eye, appear simultaneous, when the time-interval is of a certain length, this interval he measures with suitable apparatus. In chemistry we have a note by Prof. Stölbe, giving a new method of preparing boronfluoride of potassium, and an account of the properties of this substance.—Dr. Weyr investigates mathematically the distance-action of electrical solenoids on material plane surfaces, and a note by M. Domailly furnishes experimental proof of certain laws deduced by M. Dub as to the dependence of magnetic moment on the dimensions of a magnetic bar.—There are also papers on the fauna of lakes in the Bohmerwald, on basaltic formations, and on several points in mineralogy and pure mathematics.

Bulletin de l'Académie Royale de Belgique, No. 8, 1873.—In this number is described a recording *micrometer* , devised by M. Van Rysselberghe, and which seems to have some merit;

the advantage being that the readings of several different instruments can be recorded by means of a single steel graver, making traces on a varnished copper sheet. The sheet is fixed on a vertical cylinder, which rotates at equal intervals (e.g. every ten minutes), an electric circuit, of which the instrument to be observed forms part, is closed by the movement of the cylinder; this liberates the graver, which then gives a tracing proportional, in length, to the indication of the instrument. At each revolution the graver descends a little, thus a series of equidistant lines are obtained, the extremities of which form the curve of observations. The copper sheet is afterwards dipped in an acid and thus made ready for engraving.—M Terby communicates some drawings made by M Schroeter, in the end of last century, which show the configuration of the spots of Mars at that time. He finds, in these, fresh proof of the permanence of the spots.—A letter from Prof. Genocchi, of Turin, on several mathematical questions, calls forth a long report from M de Jolly with reference to the alleged impossibility of demonstrating the postulates of Euclid by plane geometry, or by any geometrical reasoning.—We further find notes on the congelation of alcoholic liquids, (Michele), on the motion of projectiles, on hypo-sulphurous acid, on some storms at Antselser in July, and other topics.

Bulletin de la Société Impériale des Naturalistes de Moscou, No. 1, 1873.—In this number there is a valuable paper of spectroscopic solar observations in 1872, by M Bredichin. Four plates are appended, showing the spectroscopic profile of the sun from July 22 to September 10. The author's results confirm, in the main, those of Secchi.—M Berg gives some particulars as to the successful acclimatisation of a Japan silk worm, the *Antheraea yama dayu*, in the Baltic provinces. Cultivators were looking in this direction partly because of the difficulty of acclimating mulberry in the north, the new animal feeds on oak leaves. One striking fact is, that some of the eggs were exposed, at times, for three days successively, to a temperature of 12° R, without apparent injury. The temperature at which the worms were kept after leaving the egg till spinning time, varied between 12° and 16° R. The entire extra-oval life of the Yama Masu in Riga is about 164 weeks, or 9 in the caterpillar, 6 in the chrysalis, and 14 in the moth stages respectively. Experiments, extending over three years, have fully shown that the scheme in question is a practicable one. We have further to note a long and interesting account, by M Wollenstein, of certain ancient meteorites named "Jalnikis," found on many of the hill-sides in Novgorod. The tombs are made of unglazed stones arranged in form of a rectangular eye, which contains the skeleton. In his study of the question whether these cemeteries belonged to ancient Novgorodians, or some other people, the author is led to assign a Slavie origin.—Among the remaining papers are a note by M Stepanoff on the development of Calyptra, and a reply by M Lubomoff to M Bredichin.

Rivista Istituto Lombardo di Scienze Lettere Rendiconti Fascicolo, XV, 1873.—In addition to a large quantity of historical and philosophical matter, which includes a fourth paper on Kant's philosophy, by C Cantoni, this number contains observations of Comet II, 1873, by S. Tempel, a long paper on the polymorphism of *Pteropoda Hyalinum*, by Drs Gibelli and Griffini, and also some anatomical and medical notices.

THE *Annali di Chimica applicata alla medicina* for September contains the usual number of notices on pharmaceutical preparations, &c.

American Journal of Science and Arts, October.—This number contains a description of some valuable improvements in the silt analysis of soils and clays, by Mr Hillgard. From minute observations on the working of the elutriating apparatus of Nobil, Schulz, Fremont, and others, he concludes that all determinations hitherto made with coarsal vessels are vitiated by irregular currents, and a kind of miniature avalanche formed by the particles. He employs a cylindrical elutriating tube, having a rotary churn attached to its base, but screened by a prof. Dana has a (continued) paper on the quartite, limestone, and associated rock of the vicinity of Great Harrington, Berkshire Co., Mass.—Mr May describes some experiments on the determination of lead as peroxide, and Mr Remen communicates a note on isomeric sulpho-salicylic acids.—Mr Bentham's anniversary address to the Linnean Society is given, also a French Academy notice of Dr. Verneuil, who did valuable service to North American geology.—We further note accounts of various survey operations in Colorado, Sierra Nevada, Utah, &c.

Atti della Reale Accademia dei Lincei (Roma, Dec. 1872). This publication contains, among other papers, an interesting description, accompanied with plates, of certain human bodies found in a remarkable state of preservation in a cemetery at Ferentino. The authors, MM Maggiorani and Moricchi, made analyses of the soil, which abounded in salts of lime having, of course, avidity for water. The ground was porous, and readily permitted passage of vapour from one stratum to another. Scarcity of humus and good ventilation were other favouring causes. There was a popular tradition that the soil was brought from Palestine, but this is thought incorrect. The mummies were throughout invaded with sporule and various other parasites, which doubtless contributed to the mummification.—A long paper by M Volpicelli offers a complete and general solution, through the geometry of situation, of the problem relating to the course of a hoise over a checked surface.—Prof. Cantoni has an article on the various modes of electrical testing (*epilavazione*) and on the influence of hypothermia in electro-taxis, in which he makes some structures on certain passages in Tyndall's little work on Electricity, referring to the existence of two fluids.—We further notice a paper by Prof. Cadet on the functions of the white nerve substance, and one by Prof Respighi on the shower of falling stars observed November 28, 1872.

SOCIETIES AND ACADEMIES

PARIS

Academy of Sciences, Oct 20.—M de Quatrefages, president, in the chair.—The following papers were read.—Theory of the movement of a point attracted towards a fixed centre, by M J Bertrand.—On Dr Rey's explanation of the solar spots, by M Faye. Dr Rey considers that the heat of a facula causes an up-rush and expansion of the superincumbent atmosphere, causing a sort of vortex through which the materials of lower strata rise, expand, cool down, and condense. M Faye, after explaining the theory in question, argued that a very simple fact overthrows it at once. Dr Rey's theory would make the vortex or spot on the sun, while the measurement of Carrington have shown that it is really in the sun.—Anatomical researches on the tardigrade *Eubacter*, by M P Guvay.—M Albin Candolle presented the last volume of the "Prodromus Systematis Naturalis Regni Vegetabilis"—The secretary reported on a number of papers on the *Phyllozoa*.—Researches on an easy method of measuring the capacity of ships, by M d'Avout.—Additional note to the monograph on the fish of the family of the *Symphycarida*, by M C Dastere.—On the production of galls on vines attacked by the *Phylloxera*, by M Max Cornu.—On the reproduction of the oak *Phylloxera*, by M Balbiani.—On the production of certain crystalline borates in the dry way, by M A Ditté. The paper in question described several borates of barium and magnesium, and also several double salts of the same class. Note on the chlorovanadates, by M P Haute-fuille.—On the production of methylamines in the manufacture of pyrolytic products.

"To the solid ground
Of Nature trusts the mind which builds for aye."—WORDSWORTH

No. 183, VOL. 8]

THURSDAY, MAY 1, 1873

[PRICE FOURPENCE

Registered as a Newspaper at the General Post Office

[All Rights are Reserved

THE HARTLEY INSTITUTION, SOUTHAMPTON

The Council require the services of a Gentleman to undertake the supervision of the Museum and Library of the Institution and to act as its Secretary Salary £150 Further information may be obtained on application to the Principal at the Institution

THE HARTLEY INSTITUTION, SOUTHAMPTON

In the Department of General Literature and Science CANDIDATES are PREPARED for the Indian Engineering College and all other Public Competitive Examination

In the Department of Engineering and Technical Science youths are trained both theoretically and by means of instruction in laboratories, workshop, and on works of actual construction, for engineering architecture, surveying, and other technical occupations and for the engineering service of India.

In the Department of Preliminary Medical Education students receive instruction in the elements of medical science, with opportunities for dispensing and hospital practice

Next term commences April 28

For prospectus address the Librarian

VICTORIA INSTITUTE, OR PHILOSOPHICAL SOCIETY

A Paper will be read on "The Flint Implements of the Drift," by W. D. Mitchell, Esq. at 8 o'clock on Tuesday May 6th Mr. Whitley's and other Collections will be exhibited, after which a Discussion will take place

The Institute meets on this occasion at the Rooms of the Society of Arts, John Street, Adelphi

* Tickets may be had on application

F. W. HENRY PETRIE, Hon. Sec.

Rooms of the Institute, 8, Adelphi Terrace, Strand

SUNDAY LECTURE SOCIETY.—LECTURES AT ST. GEORGE'S HALL, Langham Place, each SUNDAY AFTERNOON at Four precisely

Sunday May 3.—Professor W. R. CHAPMAN, M.A. (Crim. Juris), on "The Relations between Science and some Modern Poetry" The Society's lectures will be resumed in November. Members Annual Subscription, £1 Payment at the Door—One Penny, Students, and (reserved seats) One Shilling

CHARING CROSS HOSPITAL MEDICAL SCHOOL.—Summer Term on—A Course of Lectures on Zoology and Comparative Anatomy will be delivered by A. H. GARROD, Esq.

A preparatory for the examinations of the University of London, Fellowship of the College of Surgeons and Civil Service. Fee for the Course, £5 3s

A. J. FOLLOCK, M.D., Pross

UNMOUNTED MICROSCOPIC OBJECTS

IN GREAT VARIETY by a well-known Microscopist For Lists, address "Micro," care of Mr. Lusham, Chemist, Romford, Essex

THE DEPTHS OF THE SEA.—Specimens of Venus's Flower Basket (*Ursula spirographa*) as described by Dr. Wylie Thomson 11 D. &c., packed in oil forwarded with descriptive pamphlet Price 5s. Boye N. Wright 90, Great Russell Street, Bloomsbury W.C. Four Doors from Bloomsbury Street

TO BE SOLD

A COLLECTION OF FOSSILS, about 500

Species, in excellent condition, mainly from Muscovian Limestone, also many from the Lias, Oolite, and Coal, &c., and a good Slab of Portland from Stoneham Apply—L. Z., Post Office, Neston, Cheshire

FRENCH.—Conversation, Reading, Special

Teaching on Pronunciation—Translation—Correspondence, by Dr. CLAUDON, Professor, 443, Strand (opposite the Charing Cross Station) Dr. Claudon is M.D. of Paris and M.R.C.S. of England, and has had ten years' successful experience in teaching Last of reference sent free

MACMILLAN & CO., London

WORKS BY SIR SAMUEL BAKER, F.R.G.S.

THE NILE TRIBUTARIES of ABYSSINIA and the SWORD HUNTERS of the HAMKAN ARABS. Fourth and cheaper Edition, with numerous Illustrations and Maps. Crown 8vo, 6s.

The *Times* says—"It solves finally a geographical riddle which hitherto had been extremely perplexing, and it adds much to our information respecting Egyptian Abyssinia and the different races that spread over it. It contains, moreover, some notable instances of English daring and enterprising skill, it abounds in animated tales of exploits dear to the heart of the British sportsman, and it will attract even the least studious reader, as the author tells a story well, and can describe nature with uncommon power."

THE ALBERT N'YANZA GREAT BASIN of the NILE, and EXPLORATION of the NILE SOURCES. Third and cheaper edition, with numerous Illustrations and Maps. Crown 8vo, 6s.

"The author, while he equals other African explorers in judgment and daring, far exceeds them in literary capacity. He has produced two volumes which can be read straight through with ease and pleasure."—*Guardian*

"Charming writing, full—as might be expected—of incident, and free from that wearisome reiteration of useless facts which is the drawback to almost all books of African travel."—*Spectator*.

MACMILLAN & CO., London.

ENLARGEMENT OF "THE PRACTITIONER."

SANITARY MEDICINE

AND PUBLIC HEALTH.

Price 1s. 6d. Monthly

Yearly Subscription 18s. Post Free.

THE PRACTITIONER: A MONTHLY JOURNAL OF THERAPEUTICS AND PUBLIC HEALTH.

EDITED BY

FRANCIS E. ANSTIE, M.D., F.R.C.P.

Senior Assistant Physician to Westminster Hospital, and Lecturer on Medicine in Westminster Hospital School.

"PRACTITIONER" OFFICE, 29, Bedford Street, Covent Garden, W.C.
LONDON, April, 1873

THE Publishers of *The Practitioner* have much pleasure in announcing the immediate enlargement of the Journal by the addition of 16 pages in each number, which will be devoted exclusively to matters of Public Health.

The sanitary legislation of 1872 has created an entirely new set of public appointments, which must necessarily be filled by medical men.

The numerous Medical Officers of Health who have been, or will be shortly, appointed all over the country, must necessarily feel the want of some channel through which they may obtain the most recent and correct information respecting all matters which concern the important duties which they are called on to perform. At present there is no such source of information, for the casual notices of hygienic matters which appear in the ordinary medical journals, though often individually very valuable, can scarcely be said to put the subject of Public Health before the profession in a compact and continuous manner.

The Publishers of *The Practitioner* have the pleasure of announcing that the Editor has succeeded in obtaining the promised co-operation of several of the most distinguished authorities in Sanitary Medicine, in making the Public Health Department of the Journal all that it should be. Each monthly instalment will consist of three sub-sections: the first, an original article on some hygienic question of general interest, the second, a summary account of what is being done in practical hygiene in this country and on the Continent, the third, a brief mention of all new inventions in the way of apparatus and processes for carrying out the details of sanitary work.

The first number of the enlarged *Practitioner* will appear in May, or rather it will be published on the 26th of April, and arrangements have been made by which the Journal will in future always appear on the 26th of the month before its nominal date.

It has not been thought advisable to materially alter the name of the Journal, which the Publishers are happy to believe has become favourably known to a wide circle of readers. In its new series, therefore, *The Practitioner* will be merely entitled "A Monthly Journal of Therapeutics and Public Health" and under this denomination the Publishers confidently hope that it will attract a large increase of that support which the profession has already liberally given to it. In this belief they have determined not to increase the present price (1s. 6d. monthly), although their subscribers will in future obtain 16 more pages of printed matter.

THE MAY NUMBER CONTAINS:—

ORIGINAL COMMUNICATIONS:

JAMES ROSS, M.D.—The Geometrical Method in Medicine. Part III.

DR. ANSTIE.—On the Use of Ergot of Rye in the Hæmoptysis of Phthisis. Part III.

SAMUEL CRADDOCK.—Case of Strangulated Femoral Hernia with Gangrenous Gut and Imprisoned Lumbrical Worm.

The EDITOR.—Note on Dr. Dale's Case.

CLINIC OF THE MONTH.

EXTRACTS FROM BRITISH AND FOREIGN JOURNALS.

NEW DEPARTMENT OF PUBLIC HEALTH.

CONTAINING ARTICLES ON

Sanitary Organization in England.
Health Aspects of Sewage Irrigation.Propagation of Enterc Fever by the Milkman.
Protection of Europe from Cholera and Plague.

MACMILLAN AND CO. 29 & 30, BEDFORD STREET, COVENT GARDEN, LONDON

ROYAL POLYTECHNIC INSTITUTION,

309, REGENT STREET, W.

LABORATORY and CLASS ROOMS are now open for ANALYSES Pupils and Clerks and Private Students. Investigations connected with Patents conducted. *Charges* are now forming in Chemistry, Physics, and Steam.—For Fee and Syllabus apply to the Professor of Chemistry, Scientific Department, Royal Polytechnic Institution.

ROYAL COUNCIL OF EDUCATION.—

The Laboratory and Class-rooms of BERNERS College are open for Pupils EVERY DAY and EVENING. The subjects of the above Examinations can be studied either Privately or in Classes. Fees moderate. Analyses and investigations conducted.—Apply to Prof. E. V. GARDNER, F.R.S., F.S.A., 44, Berners Street, W.

SCHOOL OF CHEMISTRY,

20, GREAT MARLBOROUGH STREET,
LONDON, W.

DIRECTED BY ARTHUR VACHER.

GEOLOGICAL MUSEUM FOR SALE.—

Two Cabinets, containing 6,000 specimens (scientifically arranged) of Minerals, Rocks, and Fossils, forming a first-class private museum. Price 4,000 guineas.

Apply to Professor Tennant, 429, Strand, London W.C., who has also Elementary Collections at 2s. 6d. to 20s. in 100 guineas each. Professor Tennant gives Instructions in Mineralogy and Geology.

NEWMAN'S ENTOMOLOGIST.

A MONTHLY ILLUSTRATED JOURNAL OF BRITISH INSECTS

Conducted by EDWARD NEWMAN, F.R.S., F.E.S., &c.,

Late President of the Entomological Society.

The objects of the *Entomologist* are to give every information about Insects, more especially to work out the history of those which attack fruit and Forest Trees, Vegetables, Root and "hard" Galls, Greenhouses and Garden Plants, with a view to suggesting remedies. Notes, Observations, and Queries on every branch of the Science are solicited. To preserve a continuous record of the occurrence of rarities. To improve collections by offering a ready medium for the exchange of specimens.

Published on the First of every Month.

PRICE SIXPENCE.

SIMPSON, MARSHALL, and Co., Stationers' Hall Court.

Subscriptions for one year, post free, Six Shillings, payable in advance to Edward Newman, 5, Devonshire Street, Bishopsgate, E. Prepayment for the year effectually removes the possibility of irregular delivery by provincial booksellers.

FLETCHER'S NEW UNIVERSAL FURNACE (GAS),

for Muffles, Crucibles, Ladles, and general purposes requiring neither blast nor attention, and working at any required temperature with certainty. Small sizes for Laboratory work. Large sizes for brass and iron castings, redrawing photo. waste, photo. enamelling, etching, and all purposes where exact results are required without constant attention. More than fifteen hundred of these furnaces are now in use. Drawings and descriptions in free, by post.

THOS. FLETCHER, F.C.S., 15, Bald Street, Warrington.

FRASER'S MAGAZINE for MAY, being

No XLII. of the New Series. Edited by J. A. FROUDE, M.A.

Now ready, in One Volume 8vo, with 8 Chromo-lithographs, and above 200

Woodcuts, price 10s. 6d. cloth.

THE TROPICAL WORLD: Aspects of

Man and Nature in the Equatorial Regions of the Globe

By Dr GEORGE HAWTHORNE

By the same Author, uniformly illustrated.—

"The Sea and its Living Wonders," price 21s.
"The Polar World," price 21s.
"The Subtropical World," price 21s.
"The Tropics of Nature," price 18s.

London LONGMANS, GREEN, & CO., Paternoster Row.

NLW WORK by THE REV DR HAUGHTON, M.D.

In 8vo, with 111 Figures on Wood, price 22s. 6d. cloth.

PRINCIPLES OF ANIMAL MECHANICS.

By the Rev SAMUEL HAUGHTON, F.R.S., Fellow of Trinity College, Dublin, M.D. Dub. D.C.L. Oxon.

London LONGMANS, GREEN, & CO., Paternoster Row.

DECAISE'S SYSTEMATIC BOTANY BY HOOKER.

In One Volume, imperial 8vo, with 5,500 Woodcuts from Designs by L. Steudel and A. RICHARDS, price 52s. 6d. cloth.

A GENERAL SYSTEM OF DESCRIPTIVE

and ANALYTICAL BOTANY, comprising—1. Organography, Anatomy, and Physiology of Plants. II. Descriptions and Illustrations of the Orders. Translated from the French of P. L. MONT, M.D., and J. DECAISE, Member of the Institute, by Mrs. HOOKER, the Orders arranged after the method followed in the Universities and Schools of Great Britain, with Appendix on the Natural Method, Synonyms of the Orders, and other Additions by J. D. HOOKER, C.B., F.R.S., &c., Director of the Royal Botanic Gardens, Kew.

London LONGMANS, GREEN, & CO., Paternoster Row.

BRUNN'S LIFE OF HUMBOLDT.

Now ready, in 2 vols 8vo, with 3 Portraits, price 36s.

LIFE OF ALEXANDER VON HUM-

BOLDT. Compiled in Commemoration of the Centenary of his Birth by Herr JULIUS LÖNNBERG, Dr ROBERT AVE LAALLEMAN, and Dr ALFRED THOM. Edited by Professor BRUNN, Director of the Observatory at Leipzig. Translated by JANE and CAROLINE LASSALL.

London LONGMANS, GREEN, & CO., Paternoster Row.

"THE GARDEN,"

A Weekly Illustrated Journal Devoted Solely to Horticulture in all its branches.

THE GARDEN is conducted by WILLIAM ROBINSON, F.L.S., Author of "Hardy Flowers," "Alpine Flowers for English Gardens," "The Parks, Promenades, and Gardens of Paris," &c. and the best Writers in every department of Gardening are contributors to its pages.

The following are some of the subjects regularly treated of in its pages—
 The Flower Garden Hardy Flowers
 Landscape Gardening Town Gardens
 The Fruit Garden The Conservatory
 Garden Structures Public Gardens
 Room and Window Gardens The Greenhouse and Stove
 Notes and Questions The Household
 Market Gardening The Wild Garden
 Trees and Shrubs The Kitchen Garden

THE GARDEN may be obtained through all Newsagents and at the Railway Bookstalls, at 4d per copy. It may also be had direct from the Office at 2s for a Quarter, or 6d for a Half-year, and 12s 6d for a Year, payable in advance, and in Monthly Parts. Specimen Copies (post-free), 4d.
 35, Southampton Street, Covent Garden, W.C.

THE BREWERS' GUARDIAN:

A fortnightly paper devoted to the Protection of Brewers' Interests. Licensing Legal, and Parliamentary matters.

REVIEW OF THE MALT AND HOP TRADES, AND WINE AND SPIRIT TRADES. RUGBY.

The Official Organ of the Country Brewers' Society.
 (Founded 1852)

"The Brewers' Guardian" is published on the Evenings of every alternate Tuesday, and is the only journal officially connected with brewing interests. Subscription, 1s 6d per annum post free, dating from any quarter day. Single Copies, 1s each. Required for Transatlantic Abroad.

Office—5, Bond Court, Walbrook, London. E.C.

HOLLOWAY'S PILLS AND OINTMENT

Prevention of Weakness. Whenever circumstances produce impure blood, lessen the force or in any way disarrange the balance of circulation, stagnation takes place in the lungs, and consumption or other fatal ailment, without its discovery, threatens. Let Holloway's remedy be used, in the first for lungs of debility, or on the first symptoms of a dry hacking cough. After the chest, both before and behind, has been fomented with warm brine, and the skin has been dried with a towel, the Ointment should be well rubbed twice a day upon the chest and between the shoulders, and the Pills should be taken in alternative doses to purify the blood and cleanse the system, without weakening it, or causing, or aggravating nervous irritation.

THE ONLY CHEAP FARMERS' NEWSPAPER.

**THE CHAMBER OF
 AGRICULTURAL JOURNAL
 AND FARMERS' CHRONICLE,**

Edited by JOHN ALGERNON CLARKE, Secretary to the Central Chamber of Agriculture.

Devotes special attention to the discussions and proceedings of the Chamber of Agriculture of Great Britain (which now number upwards of 18,000 members), besides giving original papers on practical farming, and a mass of intelligence of particular value to the agriculturist.

The London Corn, Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to insure delivery to country subscribers by the first post on Tuesday morning. Price 3d, or prepaid, 12s a year post free.

Published by W. PICKERING, 21, Abchurch Lane, Strand, W.C.

RUPTURES—BY ROYAL LETTERS PATENT

WHITE'S MOC-MAIN LEVER TRUSS

It is allowed by upwards of 500 Medical Men to be the most effective invention in the curative treatment of Hernia. The use of a steel spring, so often hurtful in its effects, is here avoided; a steel bandage being worn round the body, while the requisite retaining power is supplied by the MOC-MAIN PAD and PATENT LEVER, fitting with so much ease and closeness that it cannot be detected, and may be worn during sleep. A deceptive circular may be had, and the Truss (which cannot fail to fit) forwarded by post, on the circumference of the body, a inches below the hips, being sent to the manufacturer,

JOHN WHITE, 228, Piccadilly.

Price of a single Truss, 16s, 21s, 26s 6d, and 31s 6d.
 " Double " 31s 6d, 42s, and 52s 6d. Post-free.
 " Unilateral 42s and 52s 6d.

ELASTIC STOCKINGS, KNEE-CAPS,
 &c. for Varicose Veins and all cases of Weakness, and Swelling of the leg Sprains, &c. They are porous, light in texture, and unobtrusive, and drawn on over an ordinary stocking. Price 4s 6d, 7s 6d, 10s, and 12s, each Postage free.

JOHN WHITE, Manufacturer, 228, Piccadilly, London.

Just published, in crown 8vo, 10s 6d.

UNIVERSITY BOATS:

BEING A CRITICAL INQUIRY INTO THE AFTER HEALTH OF THE MEN WHO ROWED IN THE

OXFORD AND CAMBRIDGE BOAT-RACE,

FROM THE YEAR 1829 TO 1869,

BASED ON THE PERSONAL EXPERIENCE OF THE ROWERS THEMSELVES

By JOHN ED. MORGAN, M.D., M.A. OXON., F.R.C.P.,

Late Captain of the John + (Coll. Univ.), Physician to the Manchester Royal Infirmary, Author of "Deterioration of Race," &c.

"Dr. Morgan's book presents, in a most admirable manner, full and accurate statistics of the duration of life, and of the causes of death, of all the men who have rowed in the Oxford and Cambridge boats from 1829 to 1869, and also gives letters addressed to the author by nearly every individual of the number."—*Daily News*

"We think that all lovers of the English race, all who desire to see cultivated amongst our young men a spirit of manly endurance, wholesome emulation, and who are philosophical enough to recognise the fact that vigorous physical development is more often than otherwise an index of good mental and moral attributes, are under great obligation to Dr. Morgan for his book."—*Medical Times*

"There is so much that is readable and interesting in the work to which we have referred that we cannot do better than to recommend everyone interested in the subject—and who is not—to read the work for themselves."—*Medical Press and Circular*

"Dr. Morgan has a clear, vigorous, and agreeable style of writing, and he deals with his subjects in a good-humoured tone, while the good sense and moderation of his views will commend them to unprejudiced readers."—*Illustrated London News*

MACMILLAN AND CO., London.

CLARENDON PRESS PUBLICATIONS.

A TREATISE on ELECTRICITY and MAGNETISM. By J. C. Maxwell, M.A., F.R.S., Professor of Experimental Physics in the University of Cambridge. 2 vols 8vo, 31s 6d

ELEMENTS of NATURAL PHILOSOPHY. By Prof. Sir William Thomson, F.R.S., and Prof. P. G. TAIT. Part I 8vo 9s.

THE GEOLOGY of the VALLEY of the THAMES. By John Phillips, M.A. F.R.S., Professor of Geology in the University of Oxford With Coloured Map and Numerous illustrations. 8vo, 21s

"It does not often fall to our lot to open a book devoted to Science, and to derive from it the large amount of pleasure, and at the same time of real instruction which we have found in the pages of this volume."—*Athenæum*.

"We believe that the book will remain for a very long time the standard work on geology of the secondary period."—*Pall Mall Gazette*

VESUVIUS. By Professor Phillips. With numerous Maps and Illustrations. Crown 8vo, 10s 6d.

"Professor Phillips has undertaken to give an authentic history of Vesuvius from the days of Crassus to the end of 1868, and to explain the phenomena of the burning mountain according to the laws of a rigid induction. His plan has been successfully carried out, and has resulted in a work of high value."—*Pall Mall Gazette*.

DESCRIPTIVE ASTRONOMY. A Handbook for the General Reader, and also for practical Observatory work. With 224 Illustrations and numerous Tables. By G. F. CHAMBERS, F.R.A.S., Barrister-at-law Demy 8vo, cloth, 85g pp., price 21s.

CHEMISTRY FOR STUDENTS. By A. W. Williamson, Phil. Doc., Professor of Chemistry, University College, London New Edition, with Solutions. Extra fcap 8vo. Cloth, price 8s. 6d.

"A too rare example of what a good elementary text-book in any science ought to be the language brief, simple, exact; the arrangement logical, developing in lucid order principles from facts, and keeping theory always dependent upon observation; a book that keeps the reason of the student active while he strives to master details difficult but never without interest."—*Examiner*.

EXERCISES IN PRACTICAL CHEMISTRY. By A. G. Vernon Harcourt, M.A., F.R.S., Senior Student of Christ Church, and Lee's Reader in Chemistry, and H. G. MADAN, M.A., Fellow of Queen's College, Oxford. Series I, Qualitative Exercises Crown 8vo, price 7s. 6d Second Edition.

"The volume is intended as a companion to the valuable and suggestive work on 'Theoretical Chemistry,' by Professor Williamson. It constitutes a complete guide to Qualitative Chemical Analysis. Ample instructions are given to the student at every step, and the instructions are further enforced by excellent illustrations. The first portion consists of an examination of the principal gases, and of the principal radicals and their salts, whilst the second treats of the systematic analysis of a single salt. The Appendix contains a variety of useful tables. Many useful practical hints are dispersed throughout the volume, which is one worthy in every respect of a place in the Clarendon Press Series."—*Medical Times*.

AN ELEMENTARY TREATISE ON HEAT. By Balfour Stewart, LL.D., F.R.S., Professor Natural History in Owens College, Manchester. Extra fcap. 8vo, with numerous Woodcuts and Diagrams, 7s. 6d. New Edition, revised and enlarged.

"The publication of this manual is exceedingly well timed; it includes within narrow limits the leading facts and principles of this younger-born of the Sciences, and for the mastery of the greater portion of the contents only requires ordinary intelligence on the part of the reader."—*Spectator*.

FORMS OF ANIMAL LIFE. Being Outlines of Zoological Classification Based upon Anatomical Investigation, and Illustrated by Descriptions of Specimens and of Figures. By GEORGE ROLLESTON, M.D., F.R.S., Linacre Professor of Physiology, Oxford. Demy 8vo, price 16s

"Teacher and student alike will rejoice over this volume. It supplies us in a thorough, yet easily-mastered, manner, with a vast amount of precise and important information concerning the structure of all animals save man, the descriptions being drawn in order from every sub-kingdom and each class of the animal world."—*Spectator*.

"A book of the highest character and value."—*Athenæum*.

A TREATISE ON ACOUSTICS. By W. J. Donkin, F.R.S., Savilian Professor of Astronomy in the University of Oxford. Crown 8vo, price 7s. 6d.

A SYSTEM OF PHYSICAL EDUCATION: Theoretical and Practical, with numerous Illustrations drawn by A. Macdonald, of the Oxford School of Art. By ARCHIBALD MACLAREN, The Gymnasium, Oxford. Extra fcap. 8vo, price 7s. 6d.

"The work before us is one which should be in the hands of every schoolmaster and schoolmistress. It is marked in every line by good sense, and is so clearly written that no one can mistake its rules."—*Lancet*.

A TREATISE ON NATURAL PHILOSOPHY. By Sir William Thomson, F.R.S., Professor of Natural Philosophy in the University of Glasgow, and P. G. TAIT, M.A., Professor of Natural Philosophy in the University of Edinburgh. Volume I.
[A new Edition in the Press.]

Oxford: Printed at the Clarendon Press, and published by MACMILLAN & CO., London, Publishers to the University.

WORKS BY SIR SAMUEL BAKER, F.R.G.S.

THE NILE TRIBUTARIES of ABYSSINIA and the SWORD HUNTERS of the HAMRAN ARABS. Fourth and cheaper Edition, with numerous Illustrations and Maps. Crown 8vo, 6s.

The *Times* says:—"It solves finally a geographical riddle which hitherto had been extremely perplexing, and it adds much to our information respecting Egyptian Abyssinia and the different races that spread over it. It contains, moreover, some notable instances of English daring and enterprising skill; it abounds in animated tales of exploits dear to the heart of the British sportsman; and it will attract even the least studious reader, as the author tells a story well, and can describe nature with uncommon power."

THE ALBERT N'YANZA GREAT BASIN of the NILE, and EXPLORATION of the NILE SOURCES. Third and cheaper edition, with numerous Illustrations and Maps. Crown 8vo, 6s.

"The author, while he equals other African explorers in judgment and daring, far exceeds them in literary capacity. He has produced two volumes which can be read straight through with ease and pleasure."—*Guardian*.

"Charmingly written, full—as might be expected—of incident, and free from that wearisome reiteration of useless facts which is the drawback to almost all book* of African travel."—*Spectator*.

MACMILLAN & CO., London

ENLARGEMENT OF "THE PRACTITIONER."

SANITARY MEDICINE

AND PUBLIC HEALTH.

*Price 1s 6d. Monthly**Yearly Subscription 18s. Post Free.*

THE PRACTITIONER:

A MONTHLY JOURNAL OF THERAPEUTICS AND PUBLIC HEALTH.

EDITED BY

FRANCIS E. ANSTIE, M.D., F.R.C.P.

Senior Assistant Physician to Westminster Hospital, and Lecturer on Medicine in Westminster Hospital School.

"PRACTITIONER" OFFICE, 29, Bedford Street, Covent Garden, W.C.
LONDON, April, 1873

THE Publishers of *The Practitioner* have much pleasure in announcing the immediate enlargement of the Journal by the addition of 16 pages in each number, which will be devoted exclusively to matters of Public Health.

The sanitary legislation of 1872 has created an entirely new set of public appointments, which must necessarily be filled by medical men.

The numerous Medical Officers of Health who have been, or will be shortly, appointed all over the country, must necessarily feel the want of some channel through which they may obtain the most recent and correct information respecting all matters which concern the important duties which they are called on to perform. At present there is no such source of information; for the casual notices of hygienic matters which appear in the ordinary medical journals, though often individually very valuable, can scarcely be said to put the subject of Public Health before the profession in a compact and continuous manner.

The Publishers of *The Practitioner* have the pleasure of announcing that the Editor has succeeded in obtaining the promised co-operation of several of the most distinguished authorities in Sanitary Medicine, in making the Public Health Department of the Journal all that it should be. Each monthly instalment will consist of three sub-sections: the first, an original article on some hygienic question of general interest; the second, a summary account of what is being done in practical hygiene in this country and on the Continent; the third, a brief mention of all new inventions in the way of apparatus and processes for carrying out the details of sanitary work.

The first number of the enlarged *Practitioner* will appear in May, or rather it will be published on the 26th of April; and arrangements have been made by which the journal will in future always appear on the 26th of the month before its nominal date.

It has not been thought advisable to materially alter the name of the journal, which the Publishers are happy to believe has become favourably known to a wide circle of readers. In its new series, therefore, *The Practitioner* will be merely entitled "A Monthly Journal of Therapeutics and Public Health" and under this denomination the Publishers confidently hope that it will attract a large increase of that support which the profession has already liberally given to it. In this belief they have determined not to increase the present price (1s. 6d. monthly), although their subscribers will in future obtain 16 more pages of printed matter.

THE MAY NUMBER CONTAINS:—**ORIGINAL COMMUNICATIONS:**

JAMES ROSS, M.D.—The Geometrical Method in Medicine. Part III.

DR. ANSTIE.—On the Use of Ergot of Rye in the Hæmoptysis of Phtisis. Part III.

SAMUEL CRADDOCK.—Case of Strangulated Femoral Hernia with Gangrenous Gut and Imprisoned Lumbrical Worm.

The EDITOR.—Note on Dr. Dale's Case.

Kegan Paul & Co., Library House, St. Mary-le-Strand, London, W.C., of whom may be obtained the volume for 1872 (price 1s. 6d. bound in cloth) also covers for the volume (price 1s.) and back numbers.

HOLLOWAY'S OINTMENT and PILLS.

—Variable Temperature.—After the raw cold season which has just passed by, a mild damp atmosphere will probably succeed, and in its train will come fever, cold throat, diphtheria, chest complaint, and rheumatism. Holloway's Ointment will rubbed upon the skin near the affected part, at once corrects the relaxing and depressing effects of dampness on the constitution, and spurs sickness. It penetrates to the internal textures, regulates the local circulation, assuages inflammation, soothes irritation, braces relaxed organs, and heals ulcerations. Holloway's Pills, simultaneously taken, expedite the cure. In all diseases of the throat, immediate recourse is recommended to Holloway's purifying and powerful preparations, which, judiciously employed, will prevent catarrh, consumption, and other serious disease.

THE ZOOLOGIST.

A MONTHLY JOURNAL OF NATURAL HISTORY

Conducted by FREDERICK NEWMAN, F.L.S. F.Z.S. &c.

The *Zoologist* was established in 1843 to record and preserve observations on subjects similar to those treated of in White's "Natural History of Selborne," and the success which has attended it is sufficient proof that its plan is acceptable to "out-of-door naturalists," those who delight in observing the manners, habits, the private life, the migrations, movements, nests, young and food of animals. It contains original papers and records of facts relating to Quadrupeds, Birds, Reptiles, Fishes, and Insects, together with notices of recent works on every branch of Natural History. The editor has been assisted by more than two hundred of our very best zoologists.

Published on the First of every Month

A descriptive circular may be had, and the Truss (which cannot fail to fit) forwarded by post, on the circumference of the body, 1 inch below the hips, being sent to the manufacturer.

JOHN WHITE, 208, Piccadilly.

Price of a single Truss, 10s., 12s., 15s., 20s., and 25s. 6d. Post-free.
 " Double " 32s., 36s., 40s., and 50s. 6d.
 " Umbilical " 40s. and 50s. 6d.

ELASTIC STOCKINGS, KNEE-CAPS,

&c., for Various Vermin and all cases of Weakness, and Swelling of the leg Sprains, &c. They are porous, light in texture, and impermeable, and draw on over an ordinary stocking. Price 4s. 6d., 7s. 6d., 10s., and 15s. each Postage free.

JOHN WHITE, Manufacturer, 208, Piccadilly, London.

MACMILLAN AND CO.'S SCIENTIFIC CLASS BOOKS.

NEW VOLUME JUST PUBLISHED.

LESSONS IN ELEMENTARY ANATOMY: By St. George Mivart, F.R.S., Lecturer in Comparative Anatomy at St. Mary's Hospital. With upwards of 400 Illustrations. 18mo, 6s. 6d. (This day)

VOLUMES ALREADY PUBLISHED

POPULAR ASTRONOMY.—With Illustrations. By Sir G. B. AIRY, K.C.B., Astronomer Royal. New Edition. 18mo, 4s. 6d.

The speciality of this work is the direct reference of every step to the Observatory, and the full description of the methods and instruments of observation.

ELEMENTARY LESSONS in ASTRONOMY.—By J. NORMAN LOCKYER, F.R.S., with Coloured Diagram of the Spectra of the Sun, Stars, and Nebulae, and numerous Illustrations. New Edition. 18mo, 5s. 6d.

"The book is full, clear, and sound."—*Athenaeum*

QUESTIONS on the SAME 1s. 6d.

LESSONS in ELEMENTARY BOTANY.—With numerous Illustrations. By Professor OLIVER, F.R.S., & L.S. New Edition. 18mo, 4s. 6d.

"We know of no work so well suited to direct the botanical pupil's efforts as that of Professor Oliver."—*Natural History Review*.

LESSONS in ELEMENTARY CHEMISTRY, INORGANIC and ORGANIC.—By Professor RUSSELL. With numerous Illustrations, and Chromo Lithographs of the Solar Spectra. New Edition. 18mo, 4s. 6d.

"A small, compact, carefully elaborated, and well arranged manual."—*Spectator*

ELEMENTARY LESSONS in LOGIC DEDUCTIVE and INDUCTIVE.—By Professor JEVONS. With copious Questions and Examples, and a Vocabulary of Logical Terms. New Edition. 18mo, 3s. 6d.

LESSONS in ELEMENTARY PHYSIOLOGY.—With Numerous Illustrations. By Professor RUXLEY, F.R.S. New Edition. 18mo, 4s. 6d.

"A small book, but pure gold throughout. There is not a waste of space or a superfluous word, and yet it is all clear as daylight."—*Conductor*

QUESTIONS on the SAME, 1s. 6d.
POLITICAL ECONOMY for BEGINNERS.—By MILTON F. GARRATT FAWCETT. With Questions. New Edition. 18mo, 2s. 6d.

LESSONS in ELEMENTARY PHYSICS.—By HALFOUR STEWART, F.R.S. Professor of Natural Philosophy in Owens College, Manchester. With Coloured Diagram and numerous Illustrations. New Edition. 18mo, 4s. 6d.

"The beau idéal of a scientific class book, clear, accurate, and thorough."—*Edinburgh Times*

OWENS COLLEGE JUNIOR COURSE OF PRACTICAL CHEMISTRY. By J. JONES, Chemical Master in the Grammar School, Manchester. With Treatise by Prof. Russell, F.R.S. 18mo, 2s. 6d. (New Edition in the Press)

ELEMENTARY LESSONS in PHYSICAL GEOGRAPHY. By Professor GLIKIE, F.R.S. (This day)

OTHER VOLUMES OF THE SERIES IN PREPARATION

MACMILLAN & CO., London

Just published, in crown 8vo, 10s. 6d.

UNIVERSITY BOATS:

BEING A CRITICAL INQUIRY INTO THE AFTER HEALTH OF THE MEN WHO ROWED IN THE OXFORD AND CAMBRIDGE BOAT-RACE,

FROM THE YEAR 1829 TO 1869,

BASED ON THE PERSONAL EXPERIENCE OF THE ROWERS THEMSELVES.

By JOHN ED. MORGAN, M.D., M.A. OXON., F.R.C.P.,

Late Captain of the John + (Coll. Univ.), Physician to the Manchester Royal Infirmary, Author of "Deterioration of Race," &c.

"Dr. Morgan's book presents, in a most admirable manner, full and accurate statistics of the duration of life, and of the causes of death, of all the men who have rowed in the Oxford and Cambridge boats from 1829 to 1869, and also gives letters addressed to the author by nearly every individual of the number."—*Daily News*

"We think that all lovers of the English race, all who desire to see cultivated amongst our young men a spirit of manly endurance, wholesome emulation, and who are philosophical enough to recognise the fact that vigorous physical development is more often than otherwise an index of good mental and moral attributes, are under great obligation to Dr. Morgan for his book."—*Medical Times*

"There is so much that is readable and interesting in the work to which we have referred that we cannot do better than to recommend everyone interested in the subject—and who is not—to read the work for themselves."—*Medical Press and Circular*

"Dr. Morgan has a clear, vigorous, and agreeable style of writing, and he deals with his subjects in a good-humoured tone, while the good sense and moderation of his views will commend them to unprejudiced readers."—*Illustrated London News*

MACMILLAN AND CO., London.

CLARENDON PRESS PUBLICATIONS.

A TREATISE on ELECTRICITY and MAGNETISM. By J. C. Maxwell, M.A., F.R.S., Professor of Experimental Physics in the University of Cambridge. 2 vols. 8vo, 31s. 6d.

ELEMENTS of NATURAL PHILOSOPHY. By Prof. Sir William Thomson, F.R.S., and Prof. P. G. TAIT. Part I 8vo 9s.

THE GEOLOGY of the VALLEY of the THAMES. By John Phillips, M.A. F.R.S., Professor of Geology in the University of Oxford. With Coloured Map and Numerous Illustrations. 8vo, 21s.

"It does not often fall to our lot to open a book devoted to Science, and to derive from it the large amount of pleasure, and at the same time of real instruction which we have found in the pages of this volume."—*Athenæum*.

"We believe that the book will remain for a very long time the standard work on geology of the secondary period."—*Pall Mall Gazette*.

VESUVIUS. By Professor Phillips. With numerous Maps and Illustrations. Crown 8vo, 10s. 6d.

"Professor Phillips has undertaken to give an authentic history of Vesuvius from the days of Crassus to the end of 1868, and to explain the phenomena of the burning mountain according to the laws of a right induction. His plan has been successfully carried out, and has resulted in a work of high value."—*Pall Mall Gazette*.

DESCRIPTIVE ASTRONOMY. A Handbook for the General Reader, and also for practical Observatory work. With 224 Illustrations and numerous Tables. By G. F. CHAMBERS, F.R.A.S., Barrister-at-Law. Demy 8vo, cloth, 856 pp., price 21s.

CHEMISTRY FOR STUDENTS. By A. W. Williamson, Phil. Doc., Professor of Chemistry, University College, London. New Edition, with Solutions. Extra fcap. 8vo. Cloth, price 8s. 6d.

"A too rare example of what a good elementary text-book in any science ought to be: the language brief, simple, exact; the arrangement logical, developing in lucid order principles from facts, and keeping theory always dependent upon observation; a book that keeps the reason of the student active while he strives to master details difficult but never without interest."—*Examiner*.

EXERCISES IN PRACTICAL CHEMISTRY. By A. G. Vernon Harcourt, M.A., F.R.S., Senior Student of Christ Church, and Lee's Reader in Chemistry, and H. G. MADAN, M.A., Fellow of Queen's College, Oxford. Series I, Qualitative Exercises. Crown 8vo, price 7s. 6d. Second Edition.

"The volume is intended as a companion to the valuable and suggestive work on 'Theoretical Chemistry,' by Professor Williamson. It constitutes a complete guide to Qualitative Chemical Analysis. Ample instructions are given to the student at every step, and the instructions are further enforced by excellent illustrations. The first portion consists of an examination of the principal gases, and of the principal radicals and their salts, whilst the second treats of the systematic analysis of a single salt. The Appendix contains a variety of useful tables. Many useful practical hints are dispersed throughout the volume, which is one worthy in every respect of a place in the Clarendon Press Series."—*Manchester Times*.

AN ELEMENTARY TREATISE ON HEAT. By Balfour Stewart, LL.D., F.R.S., Professor Natural History in Owens College, Manchester. Extra fcap. 8vo, with numerous Woodcuts and Diagrams, 7s. 6d. New Edition, revised and enlarged.

"The publication of this manual is exceedingly well timed; it includes within narrow limits the leading facts and principles of this younger-born of the Sciences, and for the mastery of the greater portion of the contents only requires ordinary intelligence on the part of the reader."—*Spectator*.

FORMS OF ANIMAL LIFE. Being Outlines of Zoological Classification Based upon Anatomical Investigation, and Illustrated by Descriptions of Specimens and of Figures. By GEORGE ROLLESTON, M.D., F.R.S., Lecturer Professor of Physiology, Oxford. Demy 8vo, price 16s.

"Teacher and student alike will rejoice over this volume. It supplies us in a thorough, yet easily-mastered, manner, with a vast amount of precise and important information concerning the structure of all animals save man, the descriptions being drawn in from every sub-kingdom and each class of the animal world."—*Spectator*.

"A book of the highest character and value."—*Athenæum*.

A TREATISE ON ACOUSTICS. By W. J. Donkin, F.R.S., Savilian Professor of Astronomy in the University of Oxford. Crown 8vo, price 7s. 6d.

A SYSTEM OF PHYSICAL EDUCATION: Theoretical and Practical, with numerous Illustrations drawn by A. Macdonald, of the Oxford School of Art. By ARCHIBALD MACLAREN, The Gymnasium, Oxford. Extra fcap. 8vo, price 7s. 6d.

"The work before us is one which should be in the hands of every schoolmaster and schoolmistress. It is marked in every line by good sense, and is so clearly written that no one can mistake its rules."—*Lancet*.

A TREATISE ON NATURAL PHILOSOPHY. By Sir William Thomson, F.R.S., Professor of Natural Philosophy in the University of Glasgow, and P. G. TAIT, M.A., Professor of Natural Philosophy in the University of Edinburgh. Volume I. [A new Edition in the Press.]

OXFORD: Printed at the Clarendon Press, and published by MACMILLAN & CO., London, Publishers to the University.

May 8, 1873]

NATURE

THE OCEAN SURVEY EXPEDITION.

BY DR. WYVILLE THOMSON, F.R.S.,

Director of the Scientific Staff of the *Challenger* Expedition

In 8vo, cloth, extra gilt, w¹ only 100 Illustrations and 8 Coloured Maps and Plans, price 31s 6d This day

THE DEPTHS OF THE SEA.

AN ACCOUNT OF THE GENERAL RESULTS OF THE DREDGING CRUISES

Of H M S. *Lightning* and *Porcupine* during the Summers of 1865-69-70, under the Scientific Direction of

Dr. Carpenter, F.R.S., J. Gwyn Jeffreys, F.R.S., and Dr. Wyville Thomson, F.R.S

It was the important and interesting results recorded in this volume that induced the Government to send out the great Expedition now launched under the scientific guidance of Dr. Wyville Thomson, which is spoken of as "the most important surveying expedition which has ever sailed from any country."

CONTENTS —

CHAP. I.—Introduction.

" II.—The Cruise of the *Lightning*.

" III.—The Cruises of the *Porcupine*.

" IV — " " (continued)

" V.—Deep sea Sounding.

CHAP VI.—Deep-sea Dredging

" VII —Deep-sea Temperature.

" VIII —The Gulf-stream.

" IX.—The Deep-sea Fauna

" X.—The Continuity of the Chalk.

Second Edition, in imperial 8vo, cloth, extra gilt, price 31s. 6d, Illustrated by Eleven Coloured Plates and 455 Woodcuts. This Day,

THE FORCES OF NATURE:

A POPULAR INTRODUCTION to the STUDY of PHYSICAL PHENOMENA,

By AMÉDÉE GUILLEMIN

Translated from the French by Mrs. NORMAN LOCKYER, and Edited, with Additions and Notes, by

J. NORMAN LOCKYER, F.R.S.

CONTENTS.

Book I. Gravity.—Book II. Sound.—Book III. Light.—Book IV. Heat.—Book V. Magnetism.—Book VI. The Electric Light.—Book VII. Atmospheric Meteors.

"Translator and editor have done justice to their trust. The text has all the force and flow of original writing, combining faithfulness to the author's meaning with purity and independence with regard to idiom; while the technical precision and accuracy pervading the work throughout speak of the watchful editorial supervision which has been given to every scientific detail. Nothing can well exceed the clearness and delicacy of the illustrative woodcuts borrowed from the French edition, or the purity and chromatic truth of the coloured plates. Altogether the work may be said to have no parallel, either in point of fulness or attraction, as a popular manual of physical science. . . . What we feel, however, bound to say, and what we say with pleasure, is that among works of its class no publication can stand comparison with it either in literary completeness or in artistic grace."—*Saturday Review*.

MACMILLAN & CO., London.

IMPROVED SPECTRUM APPARATUS.

JOHN BROWNING begs to call the attention of the scientific public to the fact that he has remodelled and greatly improved nearly the whole of his specialities in Spectroscopes within the last year, more particularly he would mention his Miniature Spectroscope, the Direct-vision Spectroscope, with micro metric measuring apparatus, and his Universal Automatic Spectroscope. John Browning can now supply one of these Instruments with a dispersive power equal to eleven flint-glass prisms, and so compact that it can be easily adapted to a 4 in. refracting telescope.

COLONEL CAMPBELL'S NEW SPECTROMETER.

By the aid of this contrivance, an unskilled observer may map any spectra without taking readings

JOHN BROWNING,
OPTICAL AND PHYSICAL INSTRUMENT MAKER TO THE ROYAL OBSERVATORY, &c.,

THE OCEAN SURVEY EXPEDITION.

BY DR. WYVILLE THOMSON, F.R.S.,

Director of the Scientific Staff of the *Challenger* Expedition

In 8vo, cloth, extra gilt, with nearly 100 Illustrations and 8 Coloured Maps and Plans, price 31s. 6d. This day

THE DEPTHS OF THE SEA.

AN ACCOUNT OF THE GENERAL RESULTS OF THE DREDGING CRUISES

On H.M.S. *Lightning* and *Porpoise* during the Summers of 1868-69-70, under the Scientific Direction of

Dr. Carpenter, F.R.S., J. Gwyn Jeffreys, F.R.S., and Dr. Wyville Thomson, F.R.S.

It was the important and interesting results recorded in this volume that induced the Government to send out the great Expedition now launched under the scientific guidance of Dr. Wyville Thomson, which is spoken of as "the most important surveying expedition which has ever sailed from any country."

"Nothing can be more complete than the account of the scientific results of these voyages, which are fully illustrated by woodcuts of the strange forms of life brought from the dark depths of the ocean, by charts of soundings, and elaborate tables of the deep-sea temperatures."—*Daily News*

"Even to the non-scientific reader, who understands neither Latin names nor Miller-Casella thermometers, this book may still be full of interest, if he who glances at it cares to see what a wonderful world he lives in, and how very little he knows of it. The book is worth having only for its illustrations. Looking at the engravings, it is not too much to say that no such illustrations of the peculiarly delicate and complicated forms of lower animal life have yet appeared."—*Times*

"It is not too much to say that all who wish to follow what the *Challenger* does, must be acquainted with what had been done by the other vessels previously lent by the Admiralty. . . This copiously illustrated, most interesting, and valuable record of invaluable research."—*Standard*

Second Edition, in imperial 8vo, cloth, extra gilt, price 31s. 6d., Illustrated by Eleven Coloured Plates and 455 Woodcuts. This Day,

nearly all the Feeding Substances in general use by Farmers, also the Manual Value of the Residue from each article.

Opinions of the Press

"It is clearly a very useful indicator of the values of the foods for cattle"—*Athenaeum*.

"The chart cannot fail to be very useful to the keepers of horses and meat stock, and it will be an 'eye-opener' to many who will perceive how it is they have been so often disappointed after giving large prices for fancy foods"—*Sporting Times*.

"A very useful table. The system is a very capital one, and we recommend our agricultural friends to invest a shilling, and procure one of the tables published by the Agricultural and Horticultural Association"—*Land and Water*

Price One Shilling post free.

GEOLOGY, BOTANY, &c

JOHN TYM, of Castleton (Peak of Derbyshire) has on Sale a very large assortment of Minerals and Fossils, particularly from the Lias, Coal, and Mountain limestones. Rare Specimens at reasonable prices. Students' Collections in Cabinets 150 Specimens, 6s 2s, and so on in proportion (specially arranged to illustrate Lyell, Page, Alleyne, Nicholson, Dana, &c.). Dried Mosses and Ferns in elegant folios. Flour Spar and Marble Ornaments. Catalogues post free. Address—John Tym, Castleton, near Sheffield.

HOLLOWAY'S OINTMENT and PILLS.

—Wounds and their Remedies.—When the safe treatment of diseases by these purifying preparations is so simple, and the results so fully known, it seems almost unnecessary to ask the siling to give them a trial. The Ointment is infallible in curing skin diseases, healing ulcers, arresting inflammation, reducing enlargements, and removing all external malades. In all affections of the joints, gouty, rheumatic, and scrofulous attacks, by which the health of many is drained away, Holloway's Ointment and Pills will afford indescribable relief. For bad legs, that frequent curse of old age, these medicaments are a perfect remedy; they have healed thousands on whom the old treatment was worse than useless.

RUPTURES.—BY ROYAL LETTERS PATENT.

WHITE'S MOC-MAIN LEVER TRUSS

is allowed by upwards of 300 Medical Men to be the most effective invention in the curative treatment of Hernia. The use of a steel spring, so often hurtful in its effects, is here avoided; a soft bandage being worn round the body, while the requisite retaining power is supplied by the MOC-MAIN PAD and PATENT LEVER, fitting with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fail to fit) forwarded by post, on the circumstance of the body, 4 inches below the hips, being sent to the manufacturer.

JOHN WHITE, 226, Piccadilly.

Price of a single Truss, 15s, 22s, 26s 6d, and 32s 6d } Post-free
 „ Double „ 31s 6d, 42s, and 52s 6d
 „ Umbilical 42s and 52s 6d.

ELASTIC STOCKINGS, KNEE-CAPS,

&c., for Varicose Veins and all cases of Weakness, and Swelling of the leg, Sprains, &c. They are porous, light in texture, and inexpensive, and drawn on over an ordinary stocking. Price 4s 6d, 7s 6d, 10s, and 16s each. Postage free.

SCIENTIFIC PUBLICATIONS.

THE BEGINNINGS OF LIFE: Being some Account of the Nature, Modes of Origin, and Transformations of Lower Organisms. By H. CHARLTON BASTIAN, M.D., F.R.S. With upwards of 100 illus. 2 vols., crown 8vo, 28s.

From the *Lancet*—"We commenced Dr. Bastian's luminous treatise with a strong bias in favour of the old notion of *animæ ex ovo*. We close it feeling that he has almost persuaded us to believe in spontaneous generation. We cordially recommend the volumes to our readers as presenting by far the fullest exposition of the doctrine of spontaneous generation, that has yet been published, and as containing views that will undoubtedly exercise a powerful influence on many departments of biology."

THE MODES OF ORIGIN OF THE LOWEST ORGANISMS: Including a Discussion of the Experiments of M. Pasteur, and a Reply to some Statements by Professors Huxley and Tyndall. By H. CHARLTON BASTIAN, M.D., F.R.S. Crown 8vo, 4s 6d.

ON THE GENESIS OF SPECIES. By St. George Mivart, F.R.S. Second Edition, to which Notes have been added in reference and reply to Darwin's "Descent of Man." With numerous illustrations. Crown 8vo, 9s.

"In no work in the English language has this great controversy been treated at once with the same broad and vigorous grasp of facts, and the same liberal and caudid temper"—*Saturday Review*

CONTRIBUTIONS TO THE THEORY OF NATURAL SELECTION. By A. RUSSELL WALLACE. A Series of Essays. Second Edition, with Corrections and Additions. Crown 8vo, 8s 6d.

"Of Mr. Wallace and his many contributions to philosophical biology it is not easy to speak without enthusiasm, for, putting aside their great merits, he, throughout his writings, with a modesty as rare as I believe it to be uncommon, forgets his own unquestioned claim to the honour of having originated, independently of Mr. Darwin, the theories which he so ably defends."—*Dr. Hooker's Address to the British Association*

HABIT AND INTELLIGENCE, in CONNECTION with the LAWS of MATTER and Force. A Series of Scientific Essays. By J. J. MURPHY. 2 vols. 8vo, 16s.

THE GEOLOGY and ZOOLOGY of ABYSSINIA. By W. J. BLANFORD. With Coloured Illustrations and Geological Map. 8vo, 21s.

"An Account of the Geological and Zoological Observations made by the Author in Abyssinia when accompanying the British Army on its March to Magdala in 1868."

ON A METHOD OF PREDICTING by GRAPHICAL CONSTRUCTION OCCULTATIONS of Stars by the Moon, and Solar Eclipses for any given Place. Together with more rigorous Methods for the Accurate Calculation of Longitude. By F. C. PENROSE, F.R.S. With Charts and Tables, &c. 4to, 12s.

MACMILLAN AND CO., London.

MACMILLAN & CO'S SCIENCE PRIMERS FOR ELEMENTARY SCHOOLS.

Under the joint Editorship of PROFESSORS HUXLEY, ROSCOE, AND BALFOUR STEWART.

"A method admirably suited to attract the interest and attention of young scholars. They are wonderfully clear and lucid in their instructions, simple in style, and admirable in plan."—EDUCATIONAL TIMES.

ENLARGEMENT OF "THE PRACTITIONER."

SANITARY MEDICINE

AND PUBLIC HEALTH.

Price 1s. 6s. Monthly.

Yearly Subscription 18s. Post Free.

THE PRACTITIONER:

A MONTHLY JOURNAL OF THERAPEUTICS AND PUBLIC HEALTH.

EDITED BY

FRANCIS E. ANSTIE, M.D., F.R.C.P.

Senior Assistant Physician to Westminster Hospital, and Lecturer on Medicine in Westminster Hospital School

"PRACTITIONER" OFFICE, 29, Bedford Street, Covent Garden, W.C.

LONDON, April, 1873

THE Publishers of *The Practitioner* have much pleasure in announcing the immediate enlargement of the Journal by the addition of 16 pages in each number, which will be devoted exclusively to matters of Public Health.

The sanitary legislation of 1872 has created an entirely new set of public appointments, which must necessarily be filled by medical men.

The numerous Medical Officers of Health who have been, or will be shortly, appointed all over the country, must necessarily feel the want of some channel through which they may obtain the most recent and correct information respecting all matters which concern the important duties which they are called on to perform. At present there is no such source of information, for the casual notices of hygienic matters which appear in the ordinary medical journals, though often individually very valuable, can scarcely be said to put the subject of Public Health before the profession in a compact and continuous manner.

The Publishers of *The Practitioner* have the pleasure of announcing that the Editor has succeeded in obtaining the promised co-operation of several of the most distinguished authorities in Sanitary Medicine, in making the Public Health Department of the Journal all that it should be. Each monthly instalment will consist of three sub-sections: the first, an original article on some hygienic question of general interest; the second, a summary account of what is being done in practical hygiene in this country and on the Continent; the third, a brief mention of all new inventions in the way of apparatus and processes for carrying out the details of sanitary work.

The first number of the enlarged *Practitioner* will appear in May, or rather it will be published on the 26th of April, and arrangements have been made by which the Journal will in future always appear on the 26th of the month before its nominal date.

It has not been thought advisable to materially alter the name of the Journal, which the Publishers are happy to believe has become favourably known to a wide circle of readers. In its new series, therefore, *The Practitioner* will be merely entitled "A Monthly Journal of Therapeutics and Public Health" and under this denomination the Publishers sincerely hope that it will attract a large increase of that support which the profession has already liberally given to it. In this belief they have determined not to increase the present price (1s. 6d. monthly), although their subscribers will in future obtain 16 more pages of printed matter.

THE MAY NUMBER CONTAINS:—**ORIGINAL COMMUNICATIONS:**

JAMES ROSS, M.D.—The Geometrical Method in Medicine. Part III.

DR. ANSTIE—On the Use of Ergot of Rye in the Hemoptysis of Phthisis. Part III.

SAMUEL CRADDOCK.—Case of Strangulated Femoral Hernia with Gangrenous Gut and Imprisoned Lumbrical Worm.

The Editor.—Note on Dr. Dale's Case.

IMPROVED SPECTRUM APPARATUS.

JOHN BROWNING begs to call the attention of the scientific public to the fact that he has remodelled and greatly improved nearly the whole of his specialities in Spectroscopes within the last year, more particularly he would mention his Miniature Spectroscope, the Direct-vision Spectroscopic, with micro metric measuring apparatus, and his Universal Automatic Spectroscope. John Browning can now supply one of these Instruments with a dispersive power equal to eleven flint-glass prisms, and so compact that it can be easily adapted to a 4 in. refracting telescope.

COLONEL CAMPBELL'S NEW SPECTROMETER.

By the aid of this contrivance, an unskilled observer may map any spectra without taking readings.

THE OCEAN SURVEY EXPEDITION.

BY DR. WYVILLE THOMSON, F.R.S.,

Director of the Scientific Staff of the *Challenger* Expedition.

In 8vo, cloth, extra gilt, with nearly 100 Illustrations and 8 Coloured Maps and Plans, price 31s 6d This day

THE DEPTHS OF THE SEA.

AN ACCOUNT OF THE GENERAL RESULTS OF THE DREDGING CRUISES

Of H.M.S. *Lightning* and *Porcupine* during the Summers of 1868-69-70, under the Scientific Direction of

Dr. Carpenter, F.R.S., J. Gwyn Jeffreys, F.R.S., and Dr. Wyville Thomson, F.R.S.

It was the important and interesting results recorded in this volume, that induced the Government to send out the great Expedition now launched under the scientific guidance of Dr. Wyville Thomson, which is spoken of as "the most important surveying expedition which has ever sailed from any country."

"Nothing can be more complete than the account of the scientific results of these voyages, which are fully illustrated by woodcuts of the strange forms of life brought from the dark depths of the ocean, by charts of soundings, and elaborate tables of the deep-sea temperatures."—*Daily News*

"Even to the non-scientific reader, who understands neither Latin names nor Miller-Casella thermometers, this book may still be full of interest, if he who glances at it cares to see what a wonderful world he lives in, and how very little he knows of it. The book is worth having only for its illustrations. Looking at the engravings, it is not too much to say that no such illustration of the peculiarly delicate and complicated forms of lower animal life have yet appeared."—*Times*

"It is not too much to say that all who wish to follow what the *Challenger* does, must be acquainted with what had been done by the other vessels previously lent by the Admiralty. This copiously illustrated, most interesting, and valuable record of invaluable research."—*Standard*

Second Edition, in imperial 8vo, cloth, extra gilt, price 31s. 6d., Illustrated by Eleven Coloured Plates and 455 Woodcuts. This Day,

THE FORCES OF NATURE:

A POPULAR INTRODUCTION to the STUDY of PHYSICAL PHENOMENA,

By AMÉDÉE GUILLEMIN

Translated from the French by Mrs NORMAN LOCKYER, and Edited, with Additions and Notes, by

J. NORMAN LOCKYER, F.R.S.

CONTENTS.

Book I. Gravity.—Book II. Sound.—Book III. Light.—Book IV. Heat.—Book V. Magnetism.—Book VI. The Electric Light.—Book VII. Atmospheric Meteors.

"Translator and editor have done justice to their trust. The text has all the force and flow of original writing, combining faithfulness to the author's meaning with purity and independence with regard to idiom; while the technical precision and accuracy pervading the work throughout speak of the watchful editorial supervision which has been given to every scientific detail. Nothing can well exceed the clearness and delicacy of the illustrative woodcuts borrowed from the French edition, or the purity and chromatic truth of the coloured plates. Altogether the work may be said to have no parallel, either in point of fulness or attraction, as a popular manual of physical science. . . . What we feel, however, bound to say, and what we say with pleasure, is that among works of its class no publication can stand comparison with it either in literary completeness or in artistic grace."—*Saturday Review*

"THE GARDEN,"

A Weekly Illustrated Journal Devoted Solely to Horticulture in all its branches.

THE GARDEN is conducted by WILLIAM ROBINSON, F.L.S., Author of "Hardy Flowers," "Alpine Flowers for English Gardens," "The Parks, Promenades, and Gardens of Paris," &c., and the best Writers in every department of Gardening are contributors to its pages.

The following are some of the subjects regularly treated of in its pages:—

The Flower Garden.	Town Gardens.
Landscape Gardening.	The Conservatory.
The Fruit Garden.	Public Gardens.
Garden Structures.	The Greenhouse and Stove.
Room and Window Gardens.	The Householder.
Notes and Questions.	The Wild Garden.
Market Gardening.	The Kitchen Garden.
Trees and Shrubs.	

THE GARDEN may be obtained through all Newspapers and at the Railway Bookstalls, at 6d per copy. It may also be had direct from the Office at 5s for a Quarter, 10s for a Half-year, and 19s 6d for a Year, payable in advance and in Monthly Parts. Specimen Copies (post-free), 4d. 37, Southampton Street, Covent Garden, W.C.

THE ONLY CHEAP FARMERS' NEWSPAPER.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE.

Edited by JOHN ALMOND CLARKE, Secretary to the Central Chamber of Agriculture.

Devotes special attention to the discussions and proceedings of the Chambers of Agriculture of Great Britain (which now number upwards of 18,000 members), besides giving original papers on practical farming, and a mass of intelligence of particular value to the agriculturist.

The London Corn, Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to insure delivery to country subscribers by the first post on Tuesday morning. Price 3d, or prepaid, 12s a year post free.

Published by W. PICKERING, 21, Abchurch Lane, Strand, W.C.

EDGINGTON'S GARDEN NETTING,

the cheapest and most durable, at 6d per square yard, or in quantities of 500, 1000, or 10000 yards, carriage free.

EDGINGTON'S RICK CLOTHS for 68 years have maintained their celebrity as the best.

EDGINGTON'S MARQUEES for Hire are the most elegant and capacious.

A quantity of good Second-hand Government TENTS for sale, cheap.

HOLLOWAY'S PILLS.—The world is a hard place to make one's way through without illness, yet somewhere or other disease is ever rife, and everywhere its surest opponent, this purifying medicine, is to be found, and should always be handy to carry and turn the first attack of the enemy. When symptoms of weakness first set in, they may be easily subdued by this grand remedy, which gives great and prompt relief to every oppressed organ or disordered function. These Pills regulate and strengthen digestion more readily, more efficiently, and with more certainty, than any other combination of drugs, be it ever so scientifically prescribed. Nothing can exceed the ability of Holloway's medicines to secure natural functional action.

RUPTURES.—BY ROYAL LETTERS PATENT.

WHITE'S MOC-MAIN LEVER TRUSS

is allowed by upwards of 500 Medical Men to be the most effective attention in the curative treatment of Hernia. The use of a steel spring, so often hurtful in its effects, is here avoided; a soft bandage being worn round the body, while the requisite raising power is supplied by the MOC-MAIN PAD and PATENT LEVER, being with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fail to be forwarded by post, on the circumference of the body, a notch below the hips, being sent to the manufacturer).

JOHN WHITE, 228, Piccadilly.

Price of a single Truss, 15s., 21s., 25s., 30s., and 35s. 6d.	
" Double, 31s. 6d., 42s., and 52s. 6d.	Foot-free
" Umbilical 42s. and 52s. 6d.	

ELASTIC STOCKINGS, KNEE-CAPS, &c., for Varicose Veins and all cases of Weakness, and Swelling of the legs, Sprains, &c. They are porous, light in texture, and inexpensive, and drawn on over an ordinary stocking. Price 4s. 6d., 7s. 6d., 10s., and 12s. each. Postage free.

JOHN WHITE, Manufacturer, 228, Piccadilly, London.

CLARENDON PRESS PUBLICATIONS.

A TREATISE on ELECTRICITY and MAGNETISM. By J. C. Maxwell, M.A. F.R.S., Professor of Experimental Physics in the University of Cambridge. 2 vols 8vo, 31s. 6d.

ELEMENTS of NATURAL PHILOSOPHY. By Prof. Sir William Thomson, F.R.S., and Prof. P. G. TAIT. Part I 8vo 9s.

The GEOLOGY of the VALLEY of the THAMES. By John Phillips, M.A. F.R.S., Professor of Geology in the University of Oxford. With Coloured Map and Numerous Illustrations. 8vo, 21s.

"It does not often fall to our lot to open a book devoted to Science, and to derive from it the large amount of pleasure, and at the same time of real instruction which we have found in the pages of this volume."—*Athenæum*.

"We believe that the book will remain for a very long time the standard work on geology of the secondary period."—*Full Mail Gazette*.

VESUVIUS. By Professor Phillips. With numerous Maps and Illustrations. Crown 8vo, 10s. 6d.

"Professor Phillips has undertaken to give an authentic history of Vesuvius from the days of Crassus to the end of 1868, and to explain the phenomena of the burning mountain according to the laws of a rigid induction. His plan has been successfully carried out, and has resulted in a work of high value."—*Full Mail Gazette*.

DESCRIPTIVE ASTRONOMY. A Handbook for the General Reader, and also for practical Observatory work. With 224 Illustrations and numerous Tables. By G. F. CHAMBERS, F.R.A.S., Barnister-at-law. Demy 8vo, cloth, 85s. pp., price 21s.

CHEMISTRY FOR STUDENTS. By A. W. Williamson, Phil. Doc., Professor of Chemistry, University College, London. New Edition, with Solutions. Extra fcap. 8vo. Cloth, price 8s. 6d.

"A too rare example of what a good elementary text-book in any science ought to be: the language brief, simple, exact; the arrangement logical, developing in lucid order principles from facts, and keeping theory always dependent upon observation; a book that keeps the reason of the student active while he strives to master details difficult but never without interest."—*Examiner*.

EXERCISES IN PRACTICAL CHEMISTRY. By A. G. Vernon Harcourt, M.A., F.R.S., Senior Student of Christ Church, and Lee's Reader in Chemistry, and H. G. MADAN, M.A., Fellow of Queen's College, Oxford. Series I, Qualitative Exercises. Crown 8vo, price 7s. 6d. Second Edition.

"The volume is intended as a companion to the valuable and suggestive work on 'Theoretical Chemistry,' by Professor Williamson. It constitutes a complete guide to Qualitative Chemical Analysis. Ample instructions are given to the student at every step, and the instructions are further enforced by excellent illustrations. The first portion consists of an examination of the principal gases, and of the principal radicals and their salts, whilst the second treats of the systematic analysis of a single salt. The Appendix contains a variety of useful tables. Many useful practical hints are dispersed throughout the volume, which is one worthy in every respect of a place in the Clarendon Press Series."—*Medical Times*.

AN ELEMENTARY TREATISE ON HEAT. By Balfour Stewart, LL.D., F.R.S., Professor Natural History in Owens College, Manchester. Extra fcap. 8vo, with numerous Woodcuts and Diagrams, 7s. 6d. New Edition, revised and enlarged.

"The publication of this manual is exceedingly well-timed, it includes within narrow limits the leading facts and principles of this younger-born of the Sciences, and for the mastery of the greater portion of the contents only requires ordinary intelligence on the part of the reader."—*Spectator*.

FORMS OF ANIMAL LIFE. Being Outlines of Zoological Classification Based upon Anatomical Investigation, and Illustrated by Descriptions of Specimens and of Figures. By GEORGE ROLLESTON, M.D., F.R.S., Lunatic Professor of Physiology, Oxford. Demy 8vo, price 16s.

"Teacher and student alike will rejoice over this volume. It supplies us in a thorough, yet easily mastered, manner, with a vast amount of precise and important information concerning the structure of all animals save man, the descriptions being drawn in order from every sub-kingdom and each class of the animal world."—*Spectator*.

"A book of the highest character and value."—*Athenæum*.

A TREATISE ON ACOUSTICS. By W. J. Donkin, F.R.S., Savilian Professor of Astronomy in the University of Oxford. Crown 8vo, price 7s. 6d.

A SYSTEM OF PHYSICAL EDUCATION: Theoretical and Practical, with numerous Illustrations drawn by A. Macdonald, of the Oxford School of Art. By ARCHIBALD MACLAREN, The Gymnasium, Oxford. Extra fcap. 8vo, price 7s. 6d.

"The work before us is one which should be in the hands of every schoolmaster and schoolmistress. It is marked in every line by good sense, and is so clearly written that no one can mistake its rules."—*Lancet*.

A TREATISE ON NATURAL PHILOSOPHY. By Sir William Thomson, F.R.S., Professor of Natural Philosophy in the University of Glasgow, and R. G. TAIT, M.A., Professor of Natural Philosophy in the University of Edinburgh. Volume I. [A new Edition in the Press.]

Oxford: Printed at the Clarendon Press, and published by MACMILLAN & CO., London, Publishers to the University.

ENLARGEMENT OF "THE PRACTITIONER."

SANITARY MEDICINE

AND PUBLIC HEALTH.

*Price 1s. 6d. Monthly.**Yearly Subscription 18s. Post Free.*

THE PRACTITIONER: A MONTHLY JOURNAL OF THERAPEUTICS AND PUBLIC HEALTH.

EDITED BY

FRANCIS E. ANSTIE, M.D., F.R.C.P.

Senior Assistant Physician to Westminster Hospital, and Lecturer on Medicine in Westminster Hospital School

"PRACTITIONER" OFFICE, 29, Bedford Street, Covent Garden, W.C.
LONDON, April, 1873.

THE Publishers of *The Practitioner* have much pleasure in announcing the immediate enlargement of the Journal by the addition of 16 pages in each number, which will be devoted exclusively to matters of Public Health.

The sanitary legislation of 1872 has created an entirely new set of public appointments, which must necessarily be filled by medical men.

The numerous Medical Officers of Health who have been, or will be shortly, appointed all over the country, must necessarily feel the want of some channel through which they may obtain the most recent and correct information respecting all matters which concern the important duties which they are called on to perform. At present there is no such source of information; for the casual notices of hygienic matters which appear in the ordinary medical journals, though often individually very valuable, can scarcely be said to put the subject of Public Health before the profession in a compact and continuous manner.

The Publishers of *The Practitioner* have the pleasure of announcing that the Editor has succeeded in obtaining the promised co-operation of several of the most distinguished authorities in Sanitary Medicine, in making the Public Health Department of the Journal all that it should be. Each monthly instalment will consist of three sub-sections: the first, an original article on some hygienic question of general interest; the second, a summary account of what is being done in practical hygiene in this country and on the Continent; the third, a brief mention of all new inventions in the way of apparatus and processes for carrying out the details of sanitary work.

The first number of the enlarged *Practitioner* will appear in May, or rather it will be published on the 26th of April; and arrangements have been made by which the Journal will in future always appear on the 26th of the month before its nominal date.

It has not been thought advisable to materially alter the name of the Journal, which the Publishers are happy to believe has become favourably known to a wide circle of readers. In its new series, therefore, *The Practitioner* will be merely entitled "A Monthly Journal of Therapeutics and Public Health," and under this denomination the Publishers confidently hope that it will attract a large increase of that support which the profession has already liberally given to it. In this belief they have determined not to increase the present price (1s. 6d. monthly), although their subscribers will in future obtain 16 more pages of printed matter.

THE MAY NUMBER CONTAINS:—

ORIGINAL COMMUNICATIONS.

JAMES ROSS, M.D.—The Geometrical Method in Medicine. Part III.

DR. ANSTIE.—On the Use of Ergot of Rye in the Hæmoptysis of Phthisis. Part III.

SAMUEL CRADDOCK.—Case of Strangulated Femoral Hernia with Gangrenous Gut and Imprisoned Lumbrical Worm

The EDITOR.—Note on Dr. Dale's Case.

CLINIC OF THE MONTH.

OTHER VOLUMES OF THE SERIES IN PREPARATION

IMPROVED SPECTRUM APPARATUS.

JOHN BROWNING begs to call the attention of the scientific public to the fact that he has remodelled and greatly improved nearly the whole of his specialities in Spectroscopes within the last year; more particularly he would mention his Miniature Spectroscope, the Direct-vision Spectroscope, with micro metric measuring apparatus, and his Universal Automatic Spectroscope. John Browning can now supply one of these Instruments with a dispersive power equal to eleven flint-glass prisms, and so compact that it can be easily adapted to a 4-in. refracting telescope.

COLONEL CAMPBELL'S NEW SPECTROMETER.

By the aid of this contrivance, an unskilled observer may map any spectra without taking readings

MACMILLAN & CO., London.

HOLLOWAY'S PILLS were invented in accordance with modern knowledge, modern wants, and scientific progress. Their beneficial influence is restricted to neither race nor country, and is available by all who longingly look to their health. Any abrupt change in the weather always causes much disordered action in the human body. It is a matter of primary importance to rectify every irregularity without delay, which it is in the power of every one to do, by taking Holloway's Pills. These Pills are the best preventatives of indigestion, and the mildest purgatives ever prescribed. They purify and cool the blood, and equalize the circulation through the system, even to the minutest vessel of the skin. They act admirably on the liver and kidneys.

RUPTURES.—BY ROYAL LETTERS PATENT.

WHITE'S MOC-MAIN LEVER TRUSS

TRADE MARK

is allowed by upwards of 500 Medical Men to be the most effective invention in the curative treatment of Hernia. The use of a steel spring, so often harmful in its effects, is here avoided; a soft bandage being worn round the body, while the requisite resisting power is supplied by the MOC-MAIN PAD and PATENT LEVER, fitting with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fall to fit) forwarded by post, on the circumference of the body, 2 inches below the hips, being sent to the manufacturer,

CHAUVEAU'S COMPARATIVE ANATOMY OF THE DOMESTICATED ANIMALS.

Translated from the Second French Edition and Edited by GEORGE FRASER, F.R.S., Veterinary Surgeon, Royal Engineers' Hospital, Travels on Horse back in Manchuria. "Horse shoes and Horse shoeing Annual Plagues" &c

From the *Medical Times and Gazette*, May 10th 1893

"The want of a text book on the Comparative Anatomy of the Domesticated Animals has long been felt. The description as of the text are illustrated and assisted by no less than 450 excellent woodcuts. In a work which ranges over so vast a field of anatomical detail and description, it is difficult to select any one portion for review; but our examination of it enables us to speak in high terms of its general excellence. The care and attention with which hypodermis has been cultivated on the Continent are illustrated by every page in M. Chauveau's work. If we compare the description of the arteries of the head and neck in the horse as given in Chauveau's work, with the elaborate description given in Quain or Fyfe of the same arteries in man, we shall find that in minuteness of detail the author's position is well beyond any rivalled by the hypodermis. In taking leave of this book we may congratulate Mr. Fleming on the completion of so great and useful an undertaking. He has translated his author into excellent scientific English, and his contributions (which in the text are placed between brackets) are proof of the large amount of study and research he has given to make the book as complete as possible. He has not only produced a most valuable—and in fact, the only—anatomical text book for the veterinary student, but he has given us a work to be prized by every scientific man who wishes to become acquainted with the anatomy of the higher vertebrata"

In 2 vols. with 225 Plates, containing 350 Figures, 8vo, 24s

HANDBOOK FOR

THE PHYSIOLOGICAL LABORATORY.

BY

E. KLFIN, M.D.,

Assistant Professor in the Physiological Laboratory of the Brown Institution, London

J. BURDON SANDERSON, M.D. F.R.S.,

Professor of Practical Physiology in University College, London

MICHAEL FOSTER, M.D. F.R.S.,

Fellow of, and Practitioner of Physiology in, Trinity College, Cambridge

and

I. LAUDER BRUNTON, M.D. D.Sc.

Lectures on Materia Medica in the Medical College of St. Bartholomew's Hospital

Edited by J. BURDON SANDERSON

"* This work is intended to serve as an aid and to the beginner in physiological and pathological research. It contains an exposition of the fundamental facts of the science, with explicit directions, founded on practical experience, for their demonstration

From the *Lancet*, May 3rd, 1893.

"The student is conducted by a regular and carefully considered scheme from the observation of the simplest objects to the interpretation of the most complex phenomena that occur in the body. The performance of the experiments in the book will give him a thorough knowledge of physiology as shall stand him in good stead in whatever branch of medical practice he shall hereafter be engaged. The book is perfectly unique, and will prove of equal value to both students and teachers."

J & A. CHURCHILL, New Burlington Street.

THE ONLY CHEAP FARMERS' NEWSPAPER,

THE CHAMBER OF AGRICULTURE JOURNAL

AND FARMERS' CHRONICLE,

Edited by JOHN ALGERNON CLARK, Secretary to the Central Chamber of Agriculture,

Devotes special attention to the discussions and proceedings of the Chambers of Agriculture of Great Britain (which now number upwards of 18,000 members), besides giving original papers on practical farming, and a mass of intelligence of particular value to the agriculturist.

The London Corn, Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to insure delivery to country subscribers by the first post on Tuesday morning. Price 3d., or prepaid, 1s. a year post free.

Published by W. PICKERING, 21, Arundel Street, Strand, W.C.

PRICE EIGHTEENPENCE.

THE PRACTITIONER:

A Monthly Journal of

THERAPEUTICS.

Edited by FRANCIS E. ANSTIE, M.D., F.R.C.P., Senior Assistant Physician to Westminster Hospital, and Lecturer on Materia Medica in Westminster Hospital School.

No. LIX. for JUNE, 1873, Contains—

Original Communications.—

SAMUEL CRADDOCK, F.R.C.S.—"Case of Trigeminal Neuralgia treated with the Constant Current."

G. V. POORE, M.D.—"Writers' Cramp" its Pathology and Treatment. Papers on Electro-Therapy. No. 1.—"On the Relations of Faradic Electricity to Pain."

DR. LUDWIG KIRCH—"On Chronic Poisoning with Chloral Hydrate." Translated and condensed by the Editor.

Reviews, Clinic of the Month, Extracts from British and Foreign Journals, Notes and Queries, Bibliography.

DEPARTMENT of PUBLIC HEALTH.—The Medical Officer of Health: his Prescribed Duties.—The Period of Infection in Epidemic Disease.—German Opinion on the Etiology of Enteric Fever.—The Etiology of Typhus.

NEW SERIES OF MR. PROCTOR'S SCIENTIFIC ESSAYS.

On Wednesday, June 11, in a vol. crown 8vo, price 7s 6d

LIGHT SCIENCE for LEISURE HOURS:

A Series of Familiar Essays on Scientific Subjects, Natural Phenomena, &c. By R. A. PROCTOR, B.A. Cantab, Hon. Sec. R.A.S. Second Series, as follows:—

Life of Mrs. Somerville
The Coming Transit of Venus, and British Preparations for Observing it
The Ever Widening World of Stars
Movements in the Solar System
The Great Nebula of Orion
The Sun's True Atmosphere
Something Wrong with the Sun
News from Herschel's Planet.

The Two Comets of the Year 1868: I. Brorsen's, II. Winnecke's.
Comets of Short Period
The Gulf Stream
Oceanic Circulation
Aldoum in Reply to Dr. Carpenter
The Climate of Great Britain
The Low Barometer of the Antarctic Temperate Zone

First Series, uniform, Second Edition, price 7s 6d

London: LONGMANS, GREEN, & CO., Paternoster Row.

NEWMAN'S ENTOMOLOGIST:

A MONTHLY ILLUSTRATED JOURNAL OF BRITISH INSECTS

Conducted by EDWARD NEWMAN, F.L.S. F.Z.S. &c.

Late President of the Entomological Society.

The objects of the *Entomologist* are to give every information about Insects, more especially to work out the history of those which attack Fruit and Forest Trees, Vegetables, Root and Seed Crops, Greenhouse and Garden Plants, with a view to suggesting remedies. Notes, Observations, and Queries on every branch of the Science are solicited. To preserve a continuous record of the occurrence of rarities. To improve collections by offering a ready medium for the exchange of specimens.

Published on the First of every Month

PRICE SIXPENCE.

SIMPKIN, MARSHALL, and Co., Stationers' Hall Court

* Subscriptions for one year, post free, Six Shillings, payable in advance to Edward Newman, 6, Devonshire Street, Bishopsgate, E. Prepayment by the year effectually removes the possibility of irregular delivery by provincial booksellers.

FLETCHER'S NEW UNIVERSAL FURNACE (GAS),

For Muffles, Crucibles, Ladles, and general purposes, requiring neither blast nor attention, and working at any required temperature with certainty. Small sizes for Laboratory work. Large sizes for brass and iron castings, reducing photo waste, photo etching, assaying, and all purposes where exact results are required without constant attention. More than fifteen hundred of these furnaces are now in use. Drawings and descriptions free by post.

THOS FLETCHER, F.C.S., 25, Bold Street, Warrington.

Printed by R. CLAY, Sons & TAYLOR, at 7 and 8, Broad Street HILL, in the City of London, and published by MACMILLAN & CO. at the Office, 29, and 30, Bedford Street, Covent Garden.—THURSDAY, June 5, 1873.

In the Press. By Subscription, a New Edition, greatly enlarged, with additional Illustrations, of the

GEOLOGY of the YORKSHIRE COAST.

By JOHN PHILLIPS, MA FRS FGS &c. DCL Oxon, LL.D. Camb and Dublin, Professor of Geology in the University of Oxford

The Author has at length completed arrangements for a speedy issue of the long-promised additions to this his earliest geological work. These additions are found to be so numerous and so important in regard to the sections of strata, the fields of ironstone, and the catalogues and illustrations of fossils, as to render it impracticable to provide for them in the form of a Supplement to the two former Editions, one issued in 1850, the other in 1853. He proposes now to print a limited number of copies, for Subscribers only, at the fixed price of 4s, which is estimated to cover the greatly increased cost. Geologists and others interested in the subject, who desire to receive copies, are requested to make early application, in writing, to TAYLOR and FRANCIS, Red Lion Court, Fleet Street, London, E.C.

Immediately, in one thick volume. crown 8vo, cloth, price 3s

FOODS.

By EDWARD SMITH, MD LLB FRS. Profusely Illustrated.

HENRY S. KING & CO., 65, Cornhill, and 23, Paternoster Row.

THE ZOOLOGIST.

A MONTHLY JOURNAL OF NATURAL HISTORY.

Conducted by EDWARD NEWMAN, F.L.S. F.Z.S. &c.

The *Zoologist* was established in 1843 to record and preserve observations on subjects similar to those treated of in White's "Natural History of Selborne," and the success which has attended it is sufficient proof that its plan is acceptable to "out-of-door naturalists," those who delight in observing the manners, habits, the private lives, the migrations, movements, nests, young and food of animals. It contains original papers and records of facts relating to Quadrupeds, Birds, Reptiles, Fishes, and Insects, together with notices of recent works on every branch of Natural History. The *Editor* has been assisted by more than two hundred of our very best zoologists.

Published on the First of every Month.

PRICE ONE SHILLING.

CHANGE OF PUBLISHERS.

On the 1st of every Month, pp. 32, 8vo, with at least One Plate,

SCHOOL OF CHEMISTRY,
20, GREAT MARLBOROUGH STREET,
LONDON, W.

DIRECTED BY ARTHUR VACHER, F.C.S.

The Instruction is essentially practical, there are no Lectures. Each Student works independently.

The Course of Study is arranged to qualify the Student as an Analyst and to enable him generally to apply the science to any branch of Industry. But the Students are free to pursue their own particular object.

The hours are from Ten to Four. On Saturdays the Laboratory is reserved for Ladies.

The Charge is Five Pounds per Month. This includes Instruction, Chemicals, Apparatus, &c. Occasional Students are received at the same rate, namely, Ten Shillings per Month for each Half-day in the Week. Schoolmasters requiring personal instruction pay Half-fes.

GEOLOGY, BOTANY, &c.
JOHN TYM, of Castleton (Peak of Derbyshire) has on Sale a very large assortment of Minerals and Fossils, particularly from the Lias, Coal, and Mountain Limestone. Rare Specimens at reasonable prices. Students' Collections in Cabinets, 150 Specimens, 6s. 2s., and so on in proportion (especially arranged to illustrate Lyell, Page, Alcock, Nicholson, Dana, &c.). Dried Mosses and Ferns in elegant folios. Fluor Spar and Marble Ornaments Catalogues post free. Address—John Tym, Castleton, near Sheffield.

HOLLOWAY'S PILLS AND OINTMENT.

—Premature Decay—When from free living, excessive indulgence, or the enervating effects of hot climates, the nervous system becomes shaken, the muscles flabby, the heart's action irregular, and the bodily powers generally debilitated, Holloway's remedies may be used with the certainty of their producing relief. For dyspepsia, liver complaints, sick headache and loss of appetite, this Ointment should be very well rubbed twice a day over the pit of the stomach and right side, whilst Holloway's Pills are taken in such doses as can conveniently be borne. This treatment will always restore strength and energy. Nervousness, flushes, and fainting fits may all be prevented by a timely recourse to and diligent use of these remedies.

RUPTURES—BY ROYAL LETTERS PATENT

WHITE'S MOC-MAIN LEVER TRUSS

is allowed by upwards of 500 Medical Men to be the most effective invention in the curative treatment of Hernia. The use of a steel spring, so often harmful in its effects, is here avoided, a soft bandage being worn round the body, while the requisite retaining power is supplied by the MOC-MAIN PAD and PATENT LEVER, fitting with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fail to fit) forwarded by post, on the circumference of the body, a notice below the hip, being sent to the manufacturers,

JOHN WHITE, 28, Piccadilly.

Price of a single Truss, 15s., 21s., 26s. 6d., and 32s. 6d. Post-free

EDGINGTON'S RICK CLOTHS for 68 years have maintained their celebrity as the best.

EDGINGTON'S MARQUEES for Hire are the most elegant and spacious.

EDGINGTON'S CRICKET and GARDEN TENTS are the prettiest. TIFFANY, SCRIM CANVAS, and every other kind of NETTING.

Be particular—FRED EDGINGTON & CO., Rick Cloth, &c., Manufacturers to Her Majesty, 15 (only), Old Kent Road, London, S.E.

A quantity of good Second-hand Government TENTS for sale, cheap.

Price of each Folded in Book Form, 4s. 6d. or, Mounted on Roller and Varmined, 6s.

DIAGRAMS OF NATURAL HISTORY.

These Diagrams, compiled by the Eminent Scientific Men whose names are appended, are drawn with the strictest regard to Nature, and engraved in the best style of Art. The Series consists of Eleven Subjects, each arranged so that it may be mounted in one sheet, or be divided into four sections and folded in the form of a book, thus rendering them available either for Class Exercises or Individual Study.

I.—CHARACTERISTIC BRITISH FOSSILS. By J. W. LOWRY, F.R.G.S. Exhibits nearly 600 of the more prominent Forms found in British Strata.

II.—CHARACTERISTIC BRITISH TERTIARY FOSSILS. By J. W. LOWRY, F.R.G.S. This Diagram illustrates upwards of 800 Specimens of the Tertiary Formation.

III.—FOSSIL CRUSTACEA. By J. W. SALTER, A.L.S. F.G.S., and H. WOODWARD, F.G.S. F.I.S. Consisting of about 400 Illustrations of the Orders and Sub Orders, and showing their Range in Geological Times.

IV.—THE VEGETABLE KINGDOM. By A. HENRY. Arranged according to the Natural System, each order being illustrated by various examples.

V.—MOLUSCA, the ORDERS and FAMILIES of. By Dr. WOODWARD. Represented in six Classes, illustrated by over 400 Examples.

VI.—MYRIAPODA, ARACHNIDA, CRUSTACEA, ANNELIDA, and MOLLUSCA.

By ADAM WHITE and Dr. BAIRD.

The Tribes represented are illustrated by upwards of 180 Examples.

VII.—INSECTA. By ADAM WHITE.

Contains nearly 250 Drawings of the different Orders.

VIII.—FISHES. By R. H. GOODE.

Showing over 120 of the most conspicuous Types, arranged in their Orders and Families.

IX.—REPTILIA and AMPHIBIA.

By Drs. BRILL and BAIRD.

Contains 105 Figures of the principal Typical Forms.

X.—BIRDS. By GEORGE GRAY.

Contains Drawings of 256 of the leading Illustrative Specimens.

XI.—MAMMALIA. By Dr. BAIRD.

Exhibits 145 of the chief Illustrations selected from the several Orders.

London. EDWARD STANFORD, 6 and 7, Charing Cross, S.W.

Demy fvo, cloth, 5s. (published annually).

BRITISH RAINFALL IN 1872.—The

Distribution of Rain over the British Isles during the Year 1872, as observed at about 1,700 Stations in Great Britain and Ireland. With Remarks on Various Experiments, Maps, and Illustrations. Compiled by G. J. SYMONS, F.R.S. F.R. H.S., &c.

London. EDWARD STANFORD, 6 and 7, Charing Cross, S.W.

THE ONLY CHEAP FARMERS' NEWSPAPER.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE.

Edited by JOHN ALGERNON CLARKE, Secretary to the Central Chamber of Agriculture.

Devotes special attention to the discussions and proceedings of the Chambers of Agriculture of Great Britain (which now number upwards of 16,000 members), besides giving original papers on practical farming and a mass of intelligence of particular value to the agriculturist.

The London Corn, Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to insure delivery to country subscribers by the first post on Tuesday morning. Price 3d., or prepaid, 1s. a year post free.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE,

22, Albemarle-street, London, W

The NEXT ANNUAL GENERAL MEETING will be held at
BRADFORD, commencing on Wednesday, September 17

President-Elect

J. PRESCOTT JOULE, D.C.L., LL.D., F.R.S.

NOTICE TO CONTRIBUTORS OF MEMOIRS.—Authors are re-
minded that, under an arrangement dating from 1871, the acceptance of
Memoirs, and the days on which they are to be read, are now, as far as
possible, determined by Organising Committees for the several Sections
before the beginning of the Meeting. It has therefore become necessary,
in order to give an opportunity to the Committees of doing justice to the
several communications, that each Author should prepare an Abstract of his
Memoir, of a length suitable for insertion in the published Transactions of
the Association, and that he should send it, together with the original
Memoir, by book post, on or before September 1, addressed thus:—"General
Secretaries, British Association, 22, Albemarle-street, London, W. For
Section, . . ." If it should be inconvenient to the Author that his Paper
should be read on any particular day, he is requested to send information
thereof to the Secretaries in a separate note.
Information about local arrangements may be obtained by application to
the Local Secretaries, Bradford

G. GRIFFITH, M.A., Assistant General Secretary, Harrow

SCHOOL OF CHEMISTRY,

80, GREAT MARLBOROUGH STREET,
LONDON, W.

DIRECTED BY ARTHUR VACHER, F.C.S.

The Instruction is essentially practical, there are no Lectures. Each
Student works independently.

The Course of Study is arranged to qualify the Student as an Analyst
and to enable him generally to apply the science to any branch of industry.
But the Students are free to pursue their own particular object.

The hours are from Ten to Four. On Saturdays the Laboratory is re-
served for Ladies.

The Charge is Five Pounds per Month. This includes Instruction,
Chemicals, Apparatus, &c. Occasional Students are received at the same
rate, namely, Ten Shillings per Month for each Half-day in the Week.
Schoolmasters requiring personal instruction pay Half-fees.

ROYAL POLYTECHNIC INSTITUTION,

399, REGENT STREET, W.

LABORATORY AND CLASS ROOMS are now open for ANALYSES
Pupils and Class and Private Studies. Investigations connected with
Patents Conducted. Classes are now forming in Chemistry, Physics,
and Steam.—For Fees and Syllabus apply to the Professor of Chemis-
try, Scientific Department, Royal Polytechnic Institution.

LONG VACATION.—NATURAL SCI-

ENCE.—A Cambridge M.A. (Nat. Sci. Tripos), residing in the country,
will read Biology and Chemistry with Oxford or Cambridge men during
July and August. Resident or Non-resident. Special facilities for
practical work.—Address, Canab, Lewis's Medical Library, 113, Gower
Square, London, W.C.

FRY'S "A most delicious and valuable article."

CARACAS

"It is the very finest Cocoa ever offered to the public"—*Court Circular*.

"As a delicious, refreshing, and nourishing beverage, with delicate flavour and fine aroma, it certainly surpasses anything that has yet been offered to the public"—*London Mirror*.

ROYAL COUNCIL OF EDUCATION.—

The Laboratory and Class-rooms of Harners College are open for Pupils EVERY DAY and EVENING. The subjects of the above Examinations can be studied either Privately or in Classes. Fees moderate. Analyses and investigations conducted.—Apply to Prof. E. V. GARDNER, F.E.S., F.S.A., 44, Berners Street, W.

HOLLOWAY'S PILLS.—Liver complaints

and disorders of the bowels—Incontinent diet or heedless living as regards quality or quantity of food or beverage, or unavoidable exposure to changing temperatures, are ever present to undermine the constitution. It is impossible to exaggerate the extraordinary virtues of this medicine in the treatment of all affections of the liver, or all irregularities of the bowels. For curing bowel complaints, they should be taken rather more sparingly, for every medicine in this form of an aperient requires caution, when the bowels are disordered, though a more gentle aperient than these Pills, in moderate doses, has never yet been discovered. If taken according to the printed instructions, they conquer the complaint and strengthen the system.

RUPTURES.—BY ROYAL LETTERS PATENT.

WHITE'S MOC-MAIN LEVER TRUSS

is allowed by upwards of 500 Medical Men to be the most effective invention in the curative treatment of Hernia. The use of a steel spring, so often hurtful in its effects, is here avoided; a soft bandage being worn round the body, while the requisite retaining power is supplied by the MOC-MAIN PAD and PATENT LEVER, fitting with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fail to fit) forwarded by post, on the circumference of the body, 2 inches below the hips, being sent to the manufacturer,

JOHN WHITE, 225, Piccadilly.

Price of a single Truss, 12s. 6d., 15s. 6d., and 21s. 6d. } Post-free

WORKS BY SIR SAMUEL BAKER, F.R.G.S.

THE NILE TRIBUTARIES of ABYSSINIA and the SWORD HUNTERS of the HAMRAN ARABS. Fourth and cheaper Edition, with numerous Illustrations and Maps. Crown 8vo, 6s

The *Times* says:—"It solves finally a geographical riddle which hitherto had been extremely perplexing, and it adds much to our information respecting Egyptian Abyssinia and the different races that spread over it. It contains, moreover, some notable instances of English daring and enterprising skill, it abounds in animated tales of exploits dear to the heart of the British sportsman, and it will attract even the least studious reader, as the author tells a story well, and can describe nature with uncommon power."

THE ALBERT N'YANZA GREAT BASIN of the NILE, and EXPLORATION of the NILE SOURCES. Third and cheaper edition, with numerous Illustrations and Maps Crown 8vo, 6s

"The author, while he equals other African explorers in judgment and daring, far exceeds them in literary capacity. He has produced two volumes which can be read straight through with ease and pleasure."—*Guardian*

"Charmingly written, full—as might be expected—of incident, and free from that wearisome reiteration of useless facts which is the drawback to almost all books of African travel"—*Spectator*.

MACMILLAN AND CO., London.

Now ready, a Re-issue six double volumes cloth with upwards of 1,500 Engravings on Wood, price 45s. 12s. 6d. postpaid as 48s.

THE CHILDHOOD OF THE WORLD

a Simple Account of Man in Early Times. By EDWARD CLODD, F.R.S.

"This genial little volume is a child's book as to shortness, cheapness, and simplicity of style, though the author reasonably hopes that older people will use it as a source of information not popularly accessible elsewhere as to the life of Primitive Man and its relation to our own. This book if the time has come for the public to take to it will have a certain effect in the world. It is not a mere compendium from the authors mentioned in the preface, but takes its own ground and stands by itself and for itself. Mr. Clodd has thought out his philosophy of life and used his best skill to bring it into the range of a child's view."—E. B. TYLOR, F.R.S., in NATURE.

"I read your little book with great pleasure. I have no doubt it will do good and hope you will continue your work. Nothing speaks our temper so much as having to unlearn in youth manhood and even old age so many things which we were taught as children. A book like yours will prepare a far better soil in the child's mind and I was delighted to have it to read to my children."—Letter from Professor MAX MÜLLER to the Author.

MACMILLAN & CO. London.

HOLLOWAY'S OINTMENT AND PILLS.

—Unseen Eruptions.—No means hitherto discovered are so com-
petent to cope with and conquer all blemishes, boils, eruptions, red-
ness, and roughness of the skin as these celebrated medicaments, which
are valued wherever they are known. Holloway's remedies cool the
system, regulate the circulation, and so thoroughly purify the whole
body, that whatever is hurtful must inevitably be swept away, and be
succeeded by healthy structure, which is derived from rich and pure
blood. The cosmetic virtues of this unguent have been long appre-
ciated; no toilet table is well appointed which lacks its presence, it
softens and cleanses the most fine and tender skin, and when assisted
by Holloway's Pills, is the most valuable beautifier.

THE ELEMENTS OF EMBRYOLOGY.By MICHAEL FOYER, M.A., F.R.S.,
Professor in Physiology at Trinity College, Cambridge, and
J. M. BALFOUR, Scholar of Trinity College, Cambridge

MACMILLAN & CO., London

Second Edition, crown 8vo, 3s.

**The CHILDHOOD OF THE WORLD: a
Simple Account of Man in Early Times** By EDWARD CLODD,
F.R.S.

"This general little volume is a child's book as to shortness, cheapness, and
simplicity of style, though the author reasonably hopes that older people will
use it as a source of information not popularly accessible elsewhere as to the
life of Primitive Man and its relation to our own. This book, if the
time has come for the public to take to it, will have a certain effect in the
world. It is not a mere compilation from the authors mentioned in the
preface, but takes its own ground and stands by itself and for itself. Mr
Clodd has thought out his philosophy of life and used his best skill to
bring it into the range of a child's sense."—F. B. JYLLON, F.R.S., in
NATURE

"I read your little book with great pleasure. I have no doubt it will do
good, and hope you will continue your work. Nothing spoils your temper so
much as having to unlearn in youth, manhood, and even old age, so many
things which we were taught in childhood. A book like yours will prepare a
far better soil in the child's mind, and I was delighted to have it read to
my children."—Letter from Professor J. M. BALFOUR to the Author

MACMILLAN & CO., London

THE ONLY CHEAP FARMERS' NEWSPAPER.**THE CHAMBER OF
AGRICULTURE JOURNAL
AND FARMERS' CHRONICLE.**Edited by JOHN AGERSON CLARK, Secretary to the Central Chamber of
Agriculture.

Devotes special attention to the discussions and proceedings of the Cham-
bers of Agriculture of Great Britain (which now number upwards of
20,000 members), besides giving original papers on practical farming,
and a mass of intelligence of particular value to the agriculturist.

The London Corn, Seed, Hop, Lattle, and other Markets of Monday
are specially reported in this Journal, which is despatched the same
evening so as to insure delivery to country subscribers by the first post
on Tuesday morning. Price 3s. 6d. or prepaid, 15s. a year post free.

Published by W. PICKERING, 21, Arundel Street, Strand, W.C.

RUPTURES.—BY ROYAL LETTERS PATENT.**WHITE'S MOC-MAIN LEVER TRUSS**

is allowed by upwards of 500 Medical Men to be the most effec-
tive invention in the curative treatment of Hernia. The use of
a steel spring, so often harmful in its effects, is here avoided;
a soft bandage being worn round the body, while the regulate
resting power is supplied by the MOC-MAIN PAD and
PAIN-LEVER, fitting with so much ease and convenience
that it cannot be detected, and may be worn during sleep. A
descriptive circular may be had, and the Truss (which cannot
fail to be forwarded by post, on the circumference of the body,
1 inches below the hips, being sent to the manufacturer,

OPEN SCHOLARSHIP AND EXHIBITION IN NATURAL SCIENCE.

ST. MARY'S HOSPITAL MEDICAL SCHOOL.

—A Scholarship of £60 per annum, tenable for three years, and an Exhibition of £60 for one year, awarded annually by open competition in Natural Science.

The Examination for 1873 will be held on THURSDAY, the 25th of SEPTEMBER, and following days.

For further particulars apply to the Registrar, at the Hospital, or to

W B CHADLE, M.D., Dean of the School.

SCHOOL OF CHEMISTRY,

20, GREAT MARLBOROUGH STREET,
LONDON, W.

DIRECTED BY ARTHUR VACHER, F.C.S.

The Instruction is essentially practical, there are no Lectures. Each Student works independently.

The Course of Study is arranged to qualify the Student as an Analyst and to enable him generally to apply the science to any branch of industry. But the Students are free to pursue their own particular object.

The hours are from Ten to Four. On Saturdays the Laboratory is reserved for Ladies.

The Charge is Five Pounds per Month. This includes Instruction, Chemicals, Apparatus, &c. Occasional Students are received at the same rate, namely, Ten Shillings per Month for each Half-day in the Week. Schoolmasters requiring personal instruction pay Half fees.

GEOLOGY, BOTANY, &c

JOHN TYM, of Castleton (Peak of Derbyshire).

has on Sale a very large assortment of Minerals and Fossils, particularly from the Lias, Coal, and Mountain Limestone. Rare Specimens at reasonable prices. Students' Collections in Cabinets 150 specimens, 4/6 1/2, and so on in proportion (especially arranged to illustrate Lyle, Page, Alleyne, Nicholson, Dana, &c.) Dried Mosses and Ferns in elegant folios. Fluor Spar and Marble Ornaments. Catalogues post free. Address—John Tym, Castleton, near Sheffield.

THE REV. L. HENSLEY, Vicar of Hitchin, Herts, formerly Fellow and Assistant Tutor of Trinity College, Cambridge, receives several Pupils to prepare for the Universities, and will have a Vacancy after August 3rd.

LONG VACATION.—NATURAL SCIENCE.

—A Cambridge M.A. (Nat. Sci. Tripos), residing in the country, will read Biology and Chemistry with Oxford or Cambridge men during July and August. Resident or Non-resident. Special facilities for practical work.—Address, Cantab, Lewis's Medical Library, 136, Gower Street, London, W.C.

AN INTRODUCTION TO PHYSIOLOGY

BY DR BRALE, F.R.S. Now Ready,

MEDICINE: Bioplasm Pp. 350, with 50 Plates, 6s. 6d.

J. & A. CHURCHILL

Cranford, Middlesex, within an easy and agreeable driving distance of Richmond, Kew, and London, 2½ miles from South of Station on G.W.R., and 1 from Hainewell Station on S.W.R. A Family Residence complete in all its arrangements, and as far as expenditure, skill, and care can render it, perfect for occupation.

Messrs. EDWIN SMITH AND CO are

favourably situated with instructions from Warren De La Rue to Sell by Auction at the Mart, Trenchard Street, E.C., on WEDNESDAY, August 6, at 2 o'clock (unless previously disposed of by private contract), the Freehold of "The Observatory," with its beautiful grounds, extensive water heated greenhouses and forcing-houses, orchard and walled garden two acres in extent. The residence, embellished in the highest style of decorative art, contains spacious Parlor, Dining room, Servants' room, Library and Billiard room, all of fine dimensions. Grand Oak Staircase conducting to an Ante-room and fourteen Bed, Drawing, and Bath rooms. Complete Domestic Offices, Billiard-room, and Lavatory connected with the main building by a covered way. Entrance lodge, Stabling for 5 Horses, double Coach house, circular building 24 ft. in diameter, Low-house and all necessary outbuildings, &c., in the house, so in the stables, every modern improvement has been introduced, and all fittings are the best of their respective kinds. The Observatory for astronomical purposes, unobscured by a revolving dome 19 ft. 6 in. in diameter, consists of a Transit-room and an Equatorial room, an ingeniously arranged building for photography. Water abundant and pure, soil gravel, and the property thoroughly drained into the parish sewer. An additional Pleasure ground, 2½ acres, may be rented as heretofore.—Particulars and conditions of Sale of Plans, Wilson, Hirstwood, and Carpenter, Solicitors, Copthall Buildings, Thurgarton Street, E.C., on the premises, at the Mart, of Messrs Jackson and Graham, 37 and 39, Oxford Street, and of the Auctioneers, 29, Regent Street, W.

SCIENTIFIC APPARATUS

Mr. J. C. STEVENS will Sell by Auction

at the Great Rooms, 38, King Street, Covent Garden, on FRIDAY, July 22, at half past 12 o'clock precisely, a very extensive collection of Electric, Galvanic, Magnetic, Pneumatic, Hydrostatic, Hydraulic, and Acoustic Apparatus, formerly the property of the late Rev. Alexander H. Power, of Norwich, and used by him in his public and private Scientific Lectures, and sold in consequence of his death.

May be viewed the afternoon before and morning of Sale.

HOLLOWAY'S PILLS and OINTMENT

—Stomach and Kidneys—Between these two organs there exists a close and intimate relation which is demonstrated by the warning which occurs in all diseases affecting the kidneys. The disordered stomach in often the first symptom of renal irregularity. Holloway's remedies used at that juncture would cut short many a serious and fatal attack; they act with wonderful efficacy on every organ of secretion, but especially do they regulate the stomach, liver, and kidneys in restoring their healthy functions, and casting out any obstructions or impurities. It is necessary for the Ointment to be well rubbed over the affected parts twice daily, when it is absorbed, and much augments the purifying and salutary influence of the Pills

A Weekly Illustrated Journal Devoted Solely to Horticulture in all its branches.

THE GARDEN is conducted by WILLIAM ROBINSON, F.L.S., Author of "Hardy Flowers," "Alpine Flowers for English Gardens," "The Parks, Promenades, and Gardens of Paris," &c., and the best Writers in every department of Gardening are contributors to its pages.

The following are some of the subjects regularly treated of in its pages:—

The Flower Garden.	Hardy Flowers.
Landscape Gardening.	Town Gardens.
The Fruit Garden.	The Conservatory.
Garden Structures.	Public Gardens.
Room and Window Gardens.	The Greenhouse and Store.
Notes and Questions.	The Household.
Market Gardening.	The Wild Garden.
Trees and Shrubs.	The Kitchen Garden.

THE GARDEN may be obtained through all Newspapers and at the Railway Bookstalls, at 4d per copy. It may also be had direct from the Office at 9d for a Quarter, or 3s. for a Half-Year, and 10s. 6d. for a Year, payable in advance, and in Monthly Parts. Specimen Copies (post-free), 4d.

27, Southampton Street, Covent Garden, W.C.

ROYAL POLYTECHNIC INSTITUTION,

305, REGENT STREET, W.

LABORATORY AND CLASS ROOMS are now open for ANALYSES. Pupils and Class and Private Studies Investigations connected with Patents Conducted. Classes are now forming in Chemistry, Physics, and Steam.—For Fees and Syllabus apply to the Professor of Chemistry, Scientific Department, Royal Polytechnic Institution.

ROYAL COUNCIL OF EDUCATION.—

The Laboratory and Class-rooms of BERNERS College are open for Pupils EVERY DAY and EVENING. The subjects of the above Examinations can be studied either Privately or in Classes. Fees moderate. Analyses and Syllabus applied to the Professor of Chemistry, E. V. GARDNER, F.R.S., F.S.A., 44, Berners Street, W.

"Novel, instructive, extremely interesting, and involves some of the most modern scientific researches on the subject."

LECTURE ON THE SUN.

(Illustrated.)

Address—R. DART, 13, Bedford Street, Covent Garden, London, N.B.—The Illustrations consist of Diagrams, Models, and Chemical Experiments. Mr. D will visit Bath, Exeter, Plymouth, and other Western Towns in the Autumn.

With 7 Plates, No. LI.—New Series, price 4s.

QUARTERLY JOURNAL OF MICROSCOPICAL SCIENCE.

MEMOIRS—

"A Resume of Recent Views respecting the Nature of Lichens" By W. Archer, M.R.I.A.

"On the Nature of the Gemmiferous Lichens" By Prof. S. Schwendener. Translated by W. Archer, M.R.I.A.

"On the Injecting of Objects for Microscopical Examination by means of Air-pressure" By David J. Hamilton, Junior House-Surgeon, Northern Hospital, Liverpool.

"On Cell Theories" By John Cleland, M.D. F.R.S., Professor of Anatomy and Physiology, Queen's College, Galway.

"The Development and Growth of the Layers of the Blastoderm" By F. M. Balfour, of Trinity College, Cambridge.

"On the Disappearance of the Primitive Groove in the Embryo Chick" By F. M. Balfour.

"The Development of the Blood-vessels of the Chick" By F. M. Balfour.

"On the Crystals in the Fests of the Film (*Utrina suberosa*, Ehrh.) and the Character of the Epidermis of the Tway-Blade" By George Gulliver, F.R.S.

QUARTERLY CHRONICLE OF MICROSCOPICAL SCIENCE—

Eight Thousand, with 70 Plates, 4 Coloured, cloth, 21s.

HOW TO WORK WITH THE MICROSCOPE

By Dr. LIONEL BRYAN, F.R.S. A Complete Manual of Microscopical Manipulation. New Processes of Investigation, for Examining Objects under the highest powers, Photographing specimens, &c.

HARRISON, Pall Mall.

THE ZOOLOGIST.

A MONTHLY JOURNAL OF NATURAL HISTORY

Conducted by EDWARD NEWMAN, F.L.S. F.Z.S. &c.

The *Zoologist* was established in 1843 to record and preserve observations on subjects similar to those treated of in White's "Natural History of Selborne," and the success which has attended it is sufficient proof that its plan is acceptable to "out-of-door naturalists," those who delight in observing the manners, habits, the private lives, the migrations, movements, nesting and food of animals. It contains original papers and records of facts relating to Quadrupeds, Birds, Reptiles, Fishes, and Insects, together with notices of recent works on every branch of Natural History. The editor has been assisted by more than two hundred of our very best zoologists.

Published on the First of every Month.

PRICE ONE SHILLING.

Printed by R. CLAY, SON & TAYLOR, at 7 and 8, Broad Street Hill, in the City of London, and published by MACMILLAN & Co. at the Office, 25, and 30, Bedford Street, Covent Garden, on THURSDAY, July 3, 1873.

Price 2s.

AUNT RACHEL'S LETTERS ABOUT

WATER AND AIR. A few facts about heat in relation to these substances told in simple language.

"In all respects to be commended as a book to be put into the hands of the young."—*Nature*.

From the evident care which has been taken to make the statements strictly in accord with facts ascertained at the date of publication, the young reader will have no more to unlearn hereafter than if he studied the most expensive and approved volumes by the recognized authorities of the day."—*Scientific Review*.

London LONGMANS, GREEN, & CO. Paternoster Row.

PROFESSOR TYNDALL'S AMERICAN LECTURES.

On Tuesday, July 8, will be published, with Frontispiece and Woodcuts, in crown 8vo, cloth, price 2s. 6d.

LECTURES ON LIGHT delivered in the

United States of America in the years 1872 and 1873, with an Appendix By JOHN TYNDALL, LL.D. F.R.S., Professor of Natural Philosophy in the Royal Institution of Great Britain.

London LONGMANS, GREEN, & CO. Paternoster Row.

NEW WORK BY PROFESSOR MAX MULLER

Just published, in crown 8vo, cloth, price 10s. 6d.

INTRODUCTION to the SCIENCE of

RELIGION. Four Lectures delivered at the Royal Institution, with Two Essays on Pagan Analogues and the Philosophy of Mythology. By F. MAX MULLER, M.A., Foreign Member of the French Institute, &c.

"From first to last Prof. Max Muller's book is full of such instruction as educates in the highest sense of the words 1872 and 1873, with an Appendix By JOHN TYNDALL, LL.D. F.R.S., Professor of Natural Philosophy in the Royal Institution of Great Britain.

By the same Author, Seventh Edition, 2 vols, price 15s.

"Lectures on the Science of Language."

"Chips from a German Workshop," 2 vols 8vo, 4s.

London LONGMANS, GREEN, & CO. Paternoster Row.

Now ready, price 20s.

JOURNAL of the ROYAL GEOGRAPHICAL SOCIETY

Vol. XLIII Edited by Mr H. W. BATES, Assistant Secretary.

CONTENTS

1. Explorations of the Limpopo River. By Capt. F. E. Burton. (Map)
2. Exploration of the Tula of Saka, and Volcanic Region East of Damascus. By Capt. R. F. Burton. (Map)
3. On the Neighbourhood of Bandar Maryah. By Capt. S. B. Miles
4. A Journey in Yezo. By Capt. F. Blakiston. (Map)
5. An Expedition through Manchuria. By the Archimandrite Palladius. (Map)
6. A Traveller's Journey through Chirral to Fuzailah, in 1870. By Major T. G. Montgomerie. (Map)
7. Surveys on the Road from Shiraz to Bam. By Major B. Lovett
8. The New Hebrides and Santa Cruz Group. By Lieut. A. H. Markham. (Map)
9. Geography, Climate, and Natural History of the Lake Region of Equatorial Africa. By Lieut.-Col. J. A. Grant
10. Notes on the East, North-east, and West Coasts of Yezo. By Commander H. C. St. John
11. On the "Kurood Cuten" of Central America. By Capt. L. Brine.
12. Account of the Island of Micronia. By Capt. J. E. Bevier.
13. On the Island of Sagami. By Colonel Yemuko. (Map)
14. Account of an Expedition to Explore South-Western Australia. By A. Forrest, Esq. (Map)
15. On the Physical Geography of the Bhowalpoore State. By J. W. Barnes, Esq. (Map)
16. Notes of a Reconnaissance of the Anti Libanus. By Capt. R. F. Burton. (Map)
17. Tour through the Provinces of Echigo, Echuz, Kaga, and Noto, Japan. By J. L. Troup, Esq. (Map)
18. A Visit to Fernando Noronha. By A. Rattray, Esq. (Map)
19. Papers connected with the Upper Orus Regions. By Col. H. Yule. (Map)
20. Monograph on the Orus. By Sir H. C. Rawlinson.
21. Notes on a company Map of Transilvania, or the Empire of the Vancs. By T. Saunders, Esq. (Map)

*. Fellows are requested to apply for their Copies at the Offices of the Society, 1, Savile Row, Burlington Gardens, W.

OPEN SCHOLARSHIP AND EXHIBITION IN NATURAL
SCIENCE

**ST. MARY'S HOSPITAL MEDICAL
SCHOOL**—A Scholarship of £40 per annum, tenable for three years,
and an Exhibition of £20 for one year, awarded annually by open
competition in Natural Science.
The Examination for 1873 will be held on **THURSDAY**, the 25th of
SEPTEMBER, and following days.
For further particulars apply to the Registrar, at the Hospital, or to

W. B. CHADLE, M.D., Dean of the School

SCHOOL OF CHEMISTRY,

**80, GREAT MARLBOROUGH STREET,
LONDON, W.**

DIRECTED BY ARTHUR VACHER, F.C.S.

The Instruction is essentially practical, there are no Lectures. Each
Student works independently.

The Course of Study is arranged to qualify the Student as an Analyst
and to enable him generally to apply the science to any branch of industry.
But the Students are free to pursue their own particular objects.

The hours are from Ten to Four. On Saturdays the Laboratory is re-
served for Ladies.

The Charge is Five Pounds per Month. This includes Instruction,
Chemicals, Apparatus, &c. Occasional Students are received at the same
rate, namely, Ten Shillings per Month for each Half-day in the Week.
Schoolmasters requiring personal instruction pay Half-fee.

ROYAL POLYTECHNIC INSTITUTION,

399, REGENT STREET, W.

LABORATORY AND CLASS ROOMS are now open for ANALYSES.
Pupils and Class and Private Studios. Investigations connected with
Patents Conducted. Classes are now forming in Chemistry, Physics,
and Steam.—For Fees and Syllabus apply to the Professor of Chemis-
try, Scientific Department, Royal Polytechnic Institution.

ROYAL COUNCIL OF EDUCATION.

The Laboratory and Class-rooms of Barning College are open for
Pupils EVERY DAY and EVENING. The subjects of the above
Examinations can be studied either Privately or in Classes. Fees
moderate. Analyses and investigations conducted.—Apply to Prof
E. V. GARDNER, F.R.S., F.S.A., 44, Barning Street, W.

GEOLOGY, BOTANY, &c.

**JOHN TYM, of Castleton (Peak of Derby-
shire)** has on Sale a very large assortment of Minerals and Fossils,
particularly from the Lias, Coal, and Mountain Limestone. Rare Spec-
imens at reasonable prices. Students' Collections in Cabinets 15s
apiece, 4s 6s, and so on in proportion (especially arranged to illus-
trate Lyell, Page, Alleyne, Nicholson, Dana, &c.). Dried Mosses
and Ferns in elegant folios. Fluor Spar and Marble Grains.
Catalogues post free. Address—John Tym, Castleton, near Sheffield.

**TISLEY'S IMPROVED FORM OF
OZONE GENERATOR,**

"Which gives abundance of Ozone and is not liable to be broken"—
NATURE, June 12 and 19, 1873.

AND ALL KINDS OF

Electrical, Physical, & Chemical Apparatus

MADE BY

TISLEY AND SPILLER,

172, BROMPTON ROAD, S.W.,

(Three minutes' walk from South Kensington Museum).

Agents for Hartnack's Microscope, &c., recommended by Prof.
Rutherford, M.D., F.R.S.E.

DRAPER'S INK (DICHROIC).

THE NEW BLACK INK

DIFFERING FROM ANYTHING ELSE EVER PRODUCED

Writing becomes a pleasure when this Ink is used. It has been adopted
by the principal Banks, Public Offices, and Railway Companies throughout
Ireland.

It writes almost instantly Full Black
Does not corrode steel Pens
Is cleanly to use, and not liable to
Blot.

Flows evenly from the Pen
Blotting-paper may be applied at the
moment of writing.

TO BE HAD OF ALL STATIONERS

BEWLEY AND DRAPER, DUBLIN.

FRENCH.—Conversation, Reading, Special

Lessons on Pronunciation.—Translation.—Correspondence, by Dr
CLAUDON, Parisian, 443, Strand (opposite the Charing Cross Sta-
tion). Dr Claudon is M.D. of Paris and M.R.C.S. of England, and
has had ten years' successful experience in teaching. List of references
sent free.

The REV. L. HENSLEY, Vicar of Hitchin,

Herts, formerly Fellow and Assistant Tutor of Trinity College, Cam-
bridge, receives several Pupils to prepare for the Universities, and will
have a Vacancy after August 1st.

**FOR SALE, together or separate, a Small
Collection of SHELLS and FOSSILS.** Address (prepaid) to W.N.H.,
care of Housekeeper, 16, Beaufort Buildings, Strand, W.C.

Now ready, handsomely bound in cloth (from a Design by Luke Limner), and profusely Illustrated, price 21s.

THE PRACTICAL MAGAZINE.

VOLUME I.

CONTENTS.

- The House of Roachchild, its Rise and Ramifications. (With Twelve Illustrations.)
 Making Horse-Nails by Machinery. (With Six Illustrations.)
 The Commercial and Manufacturing Industry of Russia Concerning so-called Fire-proof Buildings. By Captain Shaw, Chief Officer of the London Fire Brigade.
 The Practical Note-Book of Technical Information useful to Students and Workmen. (With numerous Illustrations.)
 Loom for Weaving Fabrics of any Width. (With Three Illustrations.)
 Brackets and Plummer Blocks. By Thomas Cargill, C.E. (With Illustrations.)
 Japanese Society, Art, and Industry. (With Four Illustrations.)
 Experiments on the Oxidation of Iron. By Professor F. Grass-Calvert, Ph.D. F.R.S.
 The Extraction of Gold and Silver from Copper Pyrites. By M. F. Llaned. Specimens of Ornamental Book-binding of the Sixteenth Century.
 Abstracts of Papers in the Magazine of the Associated Engineers, Architects, and Builders of Germany. Translated by C. W. Heckerhorn.
 Wool-scouring. By L. R. A. Wright, Ph.D. F.R.S.
 Chemistry, as applied to the Arts. Metallurgy, Chemical Manufactures, and Allied Subjects, from Foreign Periodicals, &c.
 The Hidden Treasure. (With Six Illustrations.)
 The Mineral Wealth of Spain. By D. Kinneir Clarke, C.E.
 Professor Morse. (With Portrait.)
 Agricultural Engineering. By Robert Scott Burn, C.E.
 Our Coal supply. By Leone Levi, Professor of Commerce and Commercial Law, King's College. (With Map of the British Coalfields. By Edward Hull, M.A. F.R.S.)
 Phosphatic Fertilisers.
 Notes from the North of Europe.
 Practical Engineering at the Crystal Palace.
 London Industries. No. 1, The Lucifer-match and Cigar-light Trades. By George Dodd, Author of "Days at the Factories," "Curiosities of Industries," &c.
 At Sea with a Life preserver.
 Navigable Balloon. By M. Dupuis De Lome.
 The Iron and Mineral Products of the North of England, with Biographical Sketches and Portraits of the Originators and Promoters of these Industries. (Portrait of H. W. P. Bolckow, Esq. M.P.)
 Richard Trevithick. (With numerous Illustrations.)
 A Successful Cigar-rolling Machine.
 Notes upon Farm Manufactures, Sheds, and Tanks. (Illustrated.) By Robert Scott Burn, C.E.
 United States Cotton Manufacture.
 The Manufacture of Rivets. By T. Cargill, C.E. (With numerous Illustrations.)
 New Method of Docking and Excavating Canals, and of Reclaiming Waste Land. (Illustrated.)
 Glycerine in Gas Meters.
 Experiments on the Tension of Driving-bands of Leather, India rubber, and Gutta-percha. By Fresco, Director of the Conservatoire des Arts et Metiers at Paris.
 A Mode of obtaining very long Driving-belts from Bullocks' Skins.
 Louth's Patent Three-high Plate and Sheet rolls. By George M. Fraser, C.E.
 On the Loss of Sodium in the Manufacture of Soda by Leblanc's Process. By C. R. A. Wright, D.Sc., F.R.S., Lecturer on Chemistry in St. Mary's Hospital Medical School.
 Improved Napping Machine. (With Illustration.)
 A Norwegian House.
 Art-studies from Nature, as applied to design. (With Six Illustrations.)
 Railway Platforms and Continuous Footpaths. By H. W. Pender, C.E., Wholesome Houses.
 A Waste of Water.
 Recent Examples of Belgian Patents. (With Seven Illustrations.)
 The Schuytkil and other American Waters.
 Workmen's Partnership Association at the Borthum Cast-steel Works.
 Diving Experiments in Mining.
 Self-acting direct-fountain.
 Industrial Exhibition Buildings.
 Process for the Recovery of Tin in Tin Clippings. By Adolphus Otto, of New York.
 The Agriculture of Pennsylvania. Knibworth Hall.
 The Machinery of London Lute. (By James Greenwood, the Amateur Cantor.)
 No. 1—London Cabs and Omnibuses.
 No. 2 and 3—London Food-supply—Imported Foods.
 Sir Josiah Mason. (With Portrait.)
 The Safety valve as a means of controlling Steam-pressure.
 Universal Drilling Machine. (With Illustrations.)
 The Commercial and Manufacturing Industry of Russia. Third Paper, India and the Kupraters Valley. (With Map.)
 Direct-acting Steam and Hydrostatic Press. (With Illustrations.)
 Henderson's Double Screw.
 French Porcelain. (With Illustrations.)
 Coal and Coal Mining. (With Illustrations.)
 The Industries of South Wales.
 Patent Peat-condensing Machinery.
 Workmen's Fire-escape. (With Illustrations.)
 Nautical News from America.
 The Iron and Mineral Products of the North of England, with Biographical Sketches and Portraits of the Originators and Promoters of these Industries. No. II. Joseph Pease. (With Portrait.)
 Apparatus for Lifting and Discharging Gas Reports. (With Illustration.)
 Lord Brassey's Report on the Industrial Conditions of France.
 The Carrington Rotary Gate.
 Trade and Handicraft Newspapers in London.
 Beds in Chestnut-wood. Designed by Oppier, Architect of Hanover. (With Illustration.)
 Fish Culture in the United States.
 On two recent Improvements in the Manufacture of Chlorine Fuel Economiser.
 On the Valuation of Solutions for Technical Purposes. By C. R. A. Wright, D.Sc.
 Paper-mill Trade of Scotland, with Sketch of Mr. James Baird of Gartsherrie. (With Portrait.)
 New Double-section Stone-breaker. (With Illustration.)
 Cheap Sawnings.
 Gas and its Machinery. (With Illustration.)
 Results of the last Census.
 Greeting Statue and Cup. (With Illustration.)
 The Manufacture of Brandy at the Works of Messrs J. Hennessy and Co., Cognac. (Illustrated.)
 Faneels by M. Charles Leprie, Paris. (With Illustration.)
 The Artificial Hair Trade.
 Cigar-making. (With Illustration.)
 The Plough, its History, Construction, and Management. (With numerous Illustrations.) By R. S. Burn, C.E.
 Key-Seat Lutting Machine. (With Illustrations.)
 A Commemorial for Industrious Families.
 Safety Water Tube Boiler. (With Illustrations.)
 Gum Arabic in the South.
 Oak Press. (With Illustration.)
 Geometric Turning. (With Illustrations.)
 On two recent Improvements in the Production of Chlorine. By R. Gerold, F.R.S.
 The Works of Master Sylebren. (With Illustrations.)
 The Silk Industries of Italy.
 Improvements in the Manufacture of Iron and Steel.
 Casing of the Billiard Room at Marlborough. (With Illustration.)
 Means of Protecting Feltile Fabrics, &c., from Fire.
 The Art of Secret Writing.
 Engineering and Practical Memoranda. A Lucrative Trade.
 Antidote to Arsenic Acid. Value of the Genes Rares.
 Timber Trusses and Girders.
 Mr. Galloway and the Steel Pen Trade. (With Portrait.)
 Blowing in a Blast Furnace.
 The P-steam Steam Non-Returning Engine.
 The House of Nitrogen, the Compounds of Nitrogen, and the Russian Fur and Tea Trade.
 The Lifting System of Fire arms. (With Illustration.)
 The Great Gauge Question of India.
 The Dining Arrangements of the House of Commons.
 The Siemens Direct Process for the Manufacture of Iron and Steel.
 The Westinghouse Air Brake. (With Illustrations.)
 The Slaughter houses of Paris.
 Bronze Vases incrustated in Silver. (With Illustration.)
 Otto of Roses.
 Dye Works of Messrs. Bouteau and Co., Clitay-in-Garenne. (With numerous Illustrations.)
 On the Utilisation of the Residue obtained by burning Pyrites in the Manufacture of Oil of Viper. By Dr. C. R. A. Wright.
 Tincture of Pyrethrum for Toothache.
 Apparatus for Supplying Water to Cattle upon Railways. (With Illustrations.)
 Steam in the Engine, its Heat and its Work.
 Examination of an Ancient Egyptian Perfume.
 The Collection of Murex at Chios.
 Building and Practical Memoranda. (With Illustrations.)
 Mr. James Young and the Paraffin-oil Trade of Scotland. (With Portrait.)
 The Demodops and the Mining Industry of the Urals.
 The Coal fields of Great Britain.
 The Nickel-sealed Safety-valve. (With Illustrations.)
 Thompson's Cold-dust Furnace.
 Pneumatic Dispatch, Passenger, Post, Parcel, and Telegraphic.
 The Utilisation of Blast furnace Gas.
 A further Improvement in the Production of Chlorine.
 The Mineral Wealth of Hungary.
 Soil Analysis and their Utility.
 Patent Stone-breaker and Ore-crusher. (With Illustrations.)
 On the Various Systems of Cooling the Air. (With Illustrations.)
 Grinding and Enginework by Sand-blast.
 On a four-mill fire-explosives.
 Amateur's Jug Saw.
 The Influence of Photography on Engineering Taste.
 Improved Safe Protector.
 Analytical Index, and List of Illustrations.

Eltegg Cloth Cases to bind Volume I. are now ready, price 4s., and may be had through the Bookellers or direct from the Office.

LONDON. PUBLISHED FOR THE PROPRIETARY AT No. 7, PRINTING HOUSE SQUARE, E.C.
 (Next door to the "TIMES" Office.)

Just ready, in crown 8vo, cloth, price 3s. 6d.

THE SPECTROSCOPE AND ITS APPLICATIONS

BY J. NORMAN LOCKYER, F.R.S.

WITH A COLOURED PLATE AND NUMEROUS WOODCUTS.

Being VOLUME ONE of "NATURE SERIES," a Series of Popular Scientific Works now in course of publication.

MACMILLAN & CO, London

WORKS BY SIR SAMUEL BAKER, F.R.G.S.

THE NILE TRIBUTARIES of ABYSSINIA and the SWORD HUNTERS of the HAMRAN ARABS. Fourth and cheaper Edition, with numerous Illustrations and Maps Crown 8vo, 6s

The Times says—"It solves finally a geographical riddle which hitherto had been extremely perplexing, and it adds much to our information respecting Egyptian Abyssinia and the different races that spread over it. It contains, moreover, some notable instances of English daring and enterprising skill, it abounds in animated tales of exploits dear to the heart of the British sportsman, and it will attract even the least studious reader, as the author tells a story well, and can describe nature with uncommon power."

THE ALBERT N'YANZA GREAT BASIN of the NILE, and EXPLORATION of the NILE SOURCES Third and cheaper edition, with numerous Illustrations and Maps Crown 8vo, 6s

"The author, while he equals other African explorers in judgment and daring, far exceeds them in literary capacity. He has produced two volumes which can be read straight through with ease and pleasure."—*Guardian*

"Charmingly written, full—as might be expected—of incident, and free from that wearisome reiteration of useless facts which is the drawback to almost all books of African travel."—*Spectator*.

MACMILLAN AND CO, London.

HOLLOWAY'S PILLS.—Watch the Weather

—This is perhaps the best counsel that could be circulated at this season. Will all follow it? Will everyone change his routine, as the temperature varies? The next best advice is, to have in readiness a box of Holloway's Pills, and with them to oppose the first intrusion or stop the advancing symptoms of disease. No cold, catarrh or cough should be left to itself, either may lay the foundation to danger, if not undermined by suitable means, and none can surpass Holloway's for efficiency. Hay fever, asthma, and diarrhoea, and a host of other complaints, wavering the weak and delicate, when the day is hot, with cool mornings and evenings, are cured by Holloway's medicine.

RUPTURES—BY ROYAL LETTERS PATENT

WHITE'S MOC-MAIN LEVER TRUSS

is allowed by upwards of 500 Medical Men to be the most effective invention in the curative treatment of Hernia. The use of a steel spring, so often hurtful in its effects, is here avoided, a soft bandage being worn round the body, while the requisite retaining power is supplied by the MOC-MAIN PAD and PATENT LEVER, fitting with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fail to fit) forwarded by post, on the circumference of the body, a inches below the hips, being sent to the manufacturer,

JOHN WHITE, 225, Piccadilly.

Price of a single Truss, 16s., 12s., 10s. 6d., and 8s. 6d.
 " Double " 31s. 6d., 24s., and 19s. 6d. } Post-free
 " Unbuckled 4s. and 3s. 6d.

ELASTIC STOCKINGS, KNEE-CAPS,

&c., for Varicose Veins and all cases of Weakness, and Swelling of the legs, Sprains, &c. They are porous, light in texture, and inexpensive, and draw on over an ordinary stocking. Price 4s. 6d., 3s. 6d., 2s., and 1s. each. Postage free.

JOHN WHITE, Manufacturer, 225, Piccadilly, London.

BY DR. HONEL BEALE, F.R.S.

ON KIDNEY DISEASES, URINARY

DEPOSITS, and CALCULOUS DISORDERS including the Symptoms, Diagnosis, and Treatment of Urinary Diseases Third Edition 352, upwards of 300 Illustrations.

JOURNAL OF APPLIED CHEMISTRY.

A MONTHLY PUBLICATION OF 16 PAGES QUARTO.

Devoted to Chemistry as applied to Arts and Manufactures, Agriculture, Metallurgy, &c. &c.

At Two Dollars and Twenty-five Cents per annum, or One Dollar and Seventy-five Cents paid strictly in advance, including postage to United Kingdom.

Each number contains Original Articles on General Chemistry applied to Arts and Manufactures; Matter on Particular Fabrications, as Petroleum, Soap, Tanning, Dyeing, and numerous others.

A suitable space is also devoted to Practical Recipes and interesting Scientific Facts.

Full and carefully prepared Market Reviews and Prices Current of Drugs and Chemicals of every description are given in each number for New York, Boston, and Philadelphia, with Tables of Imports.

EIGHTH VOLUME, commenced with January number.

DEXTER & CO., PUBLISHERS,

Spring Street, New York; 4, Hanover Street, Boston; and 149, South 4th Street, Philadelphia, Pa., U.S.A.

Cranford, Middlesex, within an easy and agreeable driving distance to Richmond, New and London, 11 miles from "Southall Station" on G.W.R., and 3 from Hounslow Station on S.W.R. A Family Residence complete in all its arrangements, and as far as expenditure, skill, and care can render it, perfect for occupation.

Messrs. EDWIN SMITH AND CO. are

favoured with instructions from Warren De La Rue to Sell by Auction at the Mart, Tickenhouse Yard, &c. on WEDNESDAY, August 6,

at 1 o'clock (unless previously disposed of by private contract), the Freehold of "The Observatory," with its beautiful grounds, extensive

water heated greenhouses and forcing-houses, riveted and walled garden two acres in extent. The residence, embellished in the highest

style of decorative art, contains spacious Entrance-hall, Dining-room, Servant's room, Library and Saloon, or Drawing-room, all of fine dimensions.

Grand Oak Staircase conducting to an Attic room and fourteenth

Bed, Drawing, and Bath-rooms. Complete Domestic Offices. Billiard-room, and Lavatory connected with the main building by a covered

way. Entrance-lodge, Stabling for 5 Horses, double Coach-house, circular building 43 ft. in diameter. Cow house and all necessary outbuildings, &c. in the House, as in the stables, every modern improvement

has been introduced, and all fittings are the best of their respective kinds.

The Observatory for astronomical purposes, surmounted by a revolving dome 19 ft. 6 in. in diameter, consists of a Transit room and an Equatorial-room, an appropriately arranged building for photography.

Water abundant and pure, soil gravel, and the property thoroughly drained into the parish sewer.

An additional Pleasure-ground, 21 acres, may be rented as heretofore—Particulars and Conditions of Sale at Messrs. Wilson, Dinsmore, and Carmichael, Solicitors, Copthall Buildings, 7, Longmore Street, E.C., on the premises, at the Mart of Messrs. Jackson and Graham, 37 and 38, Oxford Street, and of the Auctioneers, 309, Regent Street, W.

OPEN SCHOLARSHIP AND EXHIBITION IN NATURAL SCIENCE.

ST. MARY'S HOSPITAL MEDICAL SCHOOL

—A Scholarship of £40 per annum tenable for three years and an Exhibition of £40 for one year, awarded annually by open competition in Natural Science.
The Examinations for 1873 will be held on THURSDAY the 25th of SEPTEMBER, and following days.
For further particulars apply to the Registrar, at the Hospital or to

W B CHEADLE M.D. Dean of the School

SCHOOL OF CHEMISTRY,

20, GREAT MARLBOROUGH STREET,
LONDON, W.

DIRECTED BY ARTHUR VACHER, F.C.S.

The Instruction is essentially practical there are no Lectures Each Student works independently.

The Course of Study is arranged to qualify the Student as an Analyst and to enable him generally to apply the science to any branch of industry But the Students are free to pursue their own particular object.
The hours are from Ten to Four. On Saturdays the Laboratory is reserved for Ladies.

The Charge is Five Pounds per Month. This includes Instruction Chemicals Apparatus &c. Occasional Students are received at the same rate, namely Ten Shillings per Month for each Half day in the Week Schoolmasters requiring personal instruction pay Half fees.

ROYAL POLYTECHNIC INSTITUTION,

309 REGENT STREET, W.

LABORATORY and CLASS ROOMS are now open or ANALYSES Pupils and Class Private Studies Investigations connected with Parents Conducted. Classes are now forming in Chemistry, Physics and Steam—For Fees and Syllabus apply to the Professor of Chemistry, Scientific Department, Royal Polytechnic Institution.

ROYAL COUNCIL OF EDUCATION.—

The Laboratory and Class-rooms of Barning College are open for Pupils EVERY DAY and EVENING. The subjects of the above Examinations can be studied either Privately or in Classes. Fees moderate. Analyses and investigations conducted.—Apply to Prof. E. V. GARDNER, F.R.S., F.S.A., 44 Barning Street, W.

PRACTICAL GEOLOGY—Six Elements

LECTURES on Rocks and Metallic Minerals, adapted to a Juvenile Audience, will be given by Professor TRENKLE at his residence, 120, Strand, W.C., on July 23, 25, 26, 27, 28, 29, at Eleven a.m. and Three p.m.

Terms:—Half-a-Guinea for the Course. Five Shillings for Children of Fellows of the following Societies: Geological, Zoological, Chemical, Royal Geographical, Royal Horticultural, Geological Association, and Society of Arts.

Canford Middlesex with an easy and agreeable driving distance of Richmond, New and London 21 miles from Southall Station on G.W.R., and 3 from Hounslow station on S.W.R. A Family Residence complete in all its arrangements and as far as expenditure shall, and care can render it perfect for occupation.

Messrs. EDWIN SMITH AND CO are

favoured with instructions from Wm. De La R. to Sell by Auction at the Mart, Tokenhouse Yard, E.C. on WEDNESDAY August 6 at 2 o'clock (unless previously disposed of by private contract) the Freehold of The Observatory with its beautiful grounds extensive water heated greenhouses and forcing houses, orchard and walled garden two acres in extent. The residence embellished in the highest style of decorative art contains spacious entrance hall, Dining room, Servants room, Library and Saloon, or Drawing room, all of fine dimensions. Grand Oak staircase conducting to an Ante room and fourteen Bed Drawing and Bath rooms. Complete Domestic Office, Billiard room and Lavatory connected with the main building by a covered way. Insurance Lodge. Building for 3 Hives double Loach house, circular building 43 ft. in diameter. Low house and all necessary outbuildings &c. in the house is in the highest every modern improvement has been introduced and all fittings are the best of their respective kinds. The Observatory for astronomical purposes surmounted by a revolving dome 19 ft. 6 in. in diameter consists of a Transit room and an Equatorial room, an appropriately arranged building for photography. Water abundant and pure soil gravel and the property thoroughly drained into the parish sewer. An additional Pleasure ground, 21 acres may be rented as heretofore—Particulars and Conditions of Sale of Plans, Wilson, Brassey and Co. Engineers, 50, Collyer Buildings, Throgmorton Street, E.C. on the premises at the Mart of Messrs. Jackson and Crispin, 37 and 39 Oxford Street and of the Auctioneers, 308 Regent Street, W.

THE NORRIS COLLECTION OF SHELLS

Mr. J. C. STEVENS will Sell by Auction,

at his Great Room 38 King Street, Covent Garden, on Tuesday and Wednesday July 29th and 30th at half past 12 precisely the remaining portion of the valuable Collection of Shells formed by the late T. Norris, Esq. of Horwich House, Preston. May be viewed the day prior and mornings of sale, and Catalogues had.

MACMILLAN & CO, London

WORKS BY SIR SAMUEL BAKER, F.R.G.S.

THE NILE TRIBUTARIES of ABYSSINIA and the SWORD HUNTERS of the HAMRAN ARABS. Fourth and cheaper Edition, with numerous Illustrations and Maps. Crown 8vo, 6s.

The *Times* says:—"It solves finally a geographical riddle which hitherto had been extremely perplexing, and it adds much to our information respecting Egyptian Abyssinia and the different races that spread over it. It contains, moreover, some notable instances of English daring and enterprising skill, it abounds in animated tales of exploits dear to the heart of the British sportsman, and it will attract even the least studious reader, as the author tells a story well, and can describe nature with uncommon power."

THE ALBERT N'YANZA GREAT BASIN of the NILE, and EXPLORATION of the NILE SOURCES. Third and cheaper edition, with numerous Illustrations and Maps. Crown 8vo, 6s.

"The author, while he equals other African explorers in judgment and daring, far exceeds them in literary capacity. He has produced two volumes which can be read straight through with ease and pleasure."—*Guardian*

"Charmingly written, full—as might be expected—of incident, and free from that wearisome reiteration of useless facts which is the drawback to almost all books of African travel."—*Spectator*.

MACMILLAN AND CO., London.

MACMILLAN & CO'S SCIENCE PRIMERS FOR ELEMENTARY SCHOOLS.

Under the joint Editorship of PROFESSORS HUXLEY, ROSCOE, AND BALFOUR STEWART.

"A method admirably suited to attract the interest and attention of young scholars. They are wonderfully clear and lucid in their instructions, simple in style, and admirable in plan."—*EDUCATIONAL TIMES*

HOLLOWAY'S OINTMENT AND PILLS have lately and ever again proved the best remedy in persons afflicted with eruptions, bad legs, sores, abscesses, and other painful complicated complaints. Printed and very plain directions for the application of the Ointment and Pills are wrapped round each pot and box. Holloway's purifying Pills should be taken throughout the progress of the cure, to maintain the blood in a state of perfect purity, and to prevent the health of the whole body being jeopardised by the local ailments. All sufferers under diseases of all descriptions and of any duration, should look on the number of ailments these medicaments have checked, the thousands of afflictions they have removed from the surface and internal parts.

THE ONLY CHEAP FARMERS' NEWSPAPER.
THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE,
 Edited by JOHN AUGUSTON CLARKE, Secretary to the Central Chamber of Agriculture.

Devotes special attention to the discussion and proceedings of the Chambers of Agriculture of Great Britain (which now number upwards of 18,000 members), besides giving original papers on practical farming, and a mass of intelligence of particular value to the agriculturists.

The London Corn, Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to insure delivery to stony subscribers by the first post on Tuesday morning. Price 2s., or prepaid, 15s. a year post free.

“THE GARDEN,”

A Weekly Illustrated Journal Devoted Solely to Horticulture in all its branches

THE GARDEN is conducted by WILLIAM ROBINSON, F.L.S., Author of “Hardy Flowers,” “Alpines for English Gardens,” “The Parks, Promenades, and Gardens of Paris,” &c., and the best Writers in every department of Gardening are contributors to its pages.

The following are some of the subjects regularly treated of in its pages:—

The Flower Garden. To a Garden. The Conservatory. Public Gardens. The Greenhouse and Stove. The Household. The Wild Garden. The Kitchen Garden.

THE GARDEN may be obtained through all Newsagents and at the Railway Bookstalls, at 6d. per copy. It may also be had direct from the Office at 2s. for a Quarter, 6s. 6d. for a Half year, and 12s. 6d. for a Year, payable in advance, and in Monthly Parts. Specimen Copies (post-free), 45d.

35, Southampton Street, Covent Garden, W.C.

RUPTURES—BY ROYAL LETTERS PATENT.

WHITE'S MOC-MAIN LEVER TRUSS

It is allowed by upwards of 300 Medical Men to be the most effective invention in the curative treatment of Hernia. The use of a steel spring, so often harmful in this Affection, is here avoided, a soft bandage being worn round the body, while the requisite retaining power is supplied by the MOC-MAIN PAD and PATENT LEVER, fitting with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fail to fit) forwarded by post, on the circumference of the body, a inches below the hips, being sent to the manufacturer,

JOHN WHITE, 228, Piccadilly.

Price of a single Truss, 15s., 21s., 27s., 33s., 39s., 45s., and 51s. Post-free.
 Double 21s., 27s., 33s., 39s., 45s., and 51s.
 Umbilical 45s. and 51s. 6d.

ELASTIC STOCKINGS, KNEE-CAPS, &c., for Varicose Veins and all cases of Weakness, and Swelling of the legs, Sprains, &c. They are porous, light in texture, and inexpensive, and drawn on over an ordinary stocking. Price at 6d., 7s. 6d., 10s., and 12s. each. Postage free.

PRIMER OF ASTRONOMY. By J. N. LOCKYER, F.R.S.

HOLLOWAY'S PILLS and OINTMENT.

—Painful Cures—Sores, wounds, and other diseases affecting the skin are amenable by this cooling and healing unguent. It is called forth the loudest praises from sufferers for years, under had legs, abscesses, sores, wounds, and chronic ulcers, after every hope of cure had long passed away. None but those who have experienced the soothing effect of this Ointment, can form an idea of the comfort it bestows by restraining inflammation and allaying pain. In neuralgia, rheumatism, and gout, the same application, properly used, gives wonderful relief. Suppressed gout, by which the natural powers are paralyzed, the natural vigour blighted, the strength exhausted, comfort and happiness annihilated, is soon brought out by Holloway's purifying remedies.

FRY'S "A most delicious and valuable article"
CARACAS
Standard.
"It is the very finest Cocoa ever offered to the public."—*Court Circular*.

"As a delicious, refreshing, and nourishing beverage, with delicate flavour and fine aroma, it certainly surpasses anything that has yet been offered to the public."—*London Mirror*.

RUPTURES.—BY ROYAL LETTERS PATENT.

WHITE'S MOC-MAIN LEVER TRUSS

is allowed by upwards of 500 Medical Men to be the most effective invention in the curative treatment of Hernia. The use of a steel spring, so often hurtful in its effects, is here avoided, a soft bandage being worn round the body, while the requisite retaining power is supplied by the MOC-MAIN PAD and PATENT LEVER, fitting with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fail to fit) forwarded by post, on the circumstance of the body, a sash below the hips, being sent to the manufacturer,

JOHN WHITE, esq, Piccadilly.

Price of a single Truss, 10s, 12s, 15s 6d, and 21s 6d
" Double 21 31s 6d, 40s, and 50s 6d } Post-free
" Umbilical 40s, and 50s 6d

ELASTIC STOCKINGS, KNEE-CAPS,
&c, for Varicose Veins and all cases of Weakness, and Swelling of the legs, Sprains, &c. 1" 7/8 are porous, soft in texture, and inexpensive, and drawn on over an ordinary stocking. Price 4s 6d, 7s 6d, 10s, and 12s, each. Postage free.

JOHN WHITE, Manufacturer, esq, Piccadilly, London.

THE ONLY CHEAP FARMERS' NEWSPAPER

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE,

Edited by JOHN ALGERNON CLARKE, Secretary to the Central Chamber of Agriculture.

Devotes special attention to the discussions and proceedings of the Chambers of Agriculture of Great Britain (which now number upwards of 18,000 members), besides giving original papers on practical farming, and a mass of intelligence of particular value to the agriculturist.

The London Corn, Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to insure delivery to country subscribers by the first post on Tuesday morning. Price 3s, or prepaid, 15s a year post free. Published by W. PICKERING, esq, Arundel Street, Strand, W.C.

"THE GARDEN."

A Weekly Illustrated Journal Devoted Solely to Horticulture in all its branches.

THE GARDEN is conducted by WILLIAM ROBINSON, F.L.S., Author of "Hardy Flowers," "Alpine Flowers for English Gardens," "The Parks, Promenades, and Gardens of Paris," &c., and the best Writers in every department of Gardening are contributors to its pages.

The following are some of the subjects regularly treated of in its pages:—

The Flower Garden.	Hardy Flowers.
Landscape Gardening.	Town Gardens.
The Fruit Garden.	The Conservatory.
Garden Structures.	Public Gardens.
Rooms and Window Gardens.	The Greenhouse and Stove.
Notes and Questions.	The Household.
Market Gardening.	The Wild Garden.
Trees and Shrubs.	The Kitchen Garden.

THE GARDEN may be obtained through all Newsagents and at the Railway Bookstalls, at 4d per copy. It may also be had direct from the Office at 2s. for a Quarter, 9s 6d for a Half-year, and 18s 6d for a Year, payable in advance, and in Monthly Copies. Specimen Copies (post-free), 4d.

37, Southampton Street, Covent Garden, W.C.

WORKS BY SIR SAMUEL BAKER, F.R.G.S.**THE NILE TRIBUTARIES of ABYSSINIA and the SWORD HUNTERS of the HAMRAN ARABS.** Fourth and cheaper Edition, with numerous Illustrations and Maps. Crown 8vo, 6s.

The *Times* says:—"It solves finally a geographical riddle which hitherto had been extremely perplexing, and it adds much to our information respecting Egyptian Abyssinia and the different races that spread over it. It contains, moreover, some notable instances of English daring and enterprising skill, it abounds in animated tales of exploits dear to the heart of the British sportsman; and it will attract even the least studious reader, as the author tells a story well, and can describe nature with uncommon power."

THE ALBERT N'YANZA GREAT BASIN of the NILE, and EXPLORATION of the NILE SOURCES. Third and cheaper edition, with numerous Illustrations and Maps. Crown 8vo, 6s.

"The author, while he equals other African explorers in judgment and daring, far exceeds them in literary capacity. He has produced two volumes which can be read straight through with ease and pleasure."—*Guardian*.

"Charmingly written, full—as might be expected—of incident, and free from that wearisome reiteration of useless facts which is the drawback to almost all books of African travel."—*Spectator*.

SCHOOL OF CHEMISTRY, 20, GREAT MARLBOROUGH STREET, LONDON, W.

DIRECTED BY ARTHUR VACHER, F.C.S.

The Instruction is essentially practical, there are no Lectures. Each Student works independently.

The Course of Study is arranged to qualify the Student as an Analyst and to enable him generally to apply the science to any branch of industry.

But the Students are free to pursue their own particular object.

The hours are from Ten to Four. On Saturdays the Laboratory is reserved for Ladies.

The Charge is Five Pounds per Month. This includes Instruction, Chemicals, Apparatus, &c. Occasional Students are received at the same rate, namely, Ten shillings per Month for each Half-day in the Week.

Schoolmasters requiring personal instruction pay Half-fees.

ROYAL POLYTECHNIC INSTITUTION,

309, REGENT STREET, W.

LABORATORY and CLASS ROOMS are now open for ANALYSES. Pupils and Class and Private Studies investigations connected with Patents Conducted. Classes are now forming in Chemistry, Physics, and Steam. For Fees and Syllabus apply to the Professor of Chemistry, Scientific Department, Royal Polytechnic Institution.

ROYAL COUNCIL OF EDUCATION.

The Laboratory and Class-rooms of BERNERS COLLEGE are open for Pupils EVERY DAY and EVENING. The subjects of the above Examinations can be studied either Privately or in Classes. Fees moderate. Analyses and investigations conducted.—Apply to Prof. E. V. GARDNER, F.R.S., F.S.A., 44, Berners Street, W.

TISLEY'S IMPROVED FORM OF OZONE GENERATOR,

MR PROCTOR'S NEW WORK ON THE MOON

In One Volume, crown 8vo, cloth, with 22 Lithographic Plates, Charts, and Diagrams, 1 Wood Engraving, and 1 Lunar Photograph by Rutherford, of New York. Price 12s.

THE MOON: her Motions, Aspect, Secernery, and Physical Condition. By RICHARD A. PROCTOR, F.R.S., Astronomer Royal. Author of "Other Worlds than Ours," "Saturn and its System," "The Orbs Around Us," &c.

London LONGMANS, GREEN, & CO., Peterborough Row.

Second Edition, crown 8vo, 3s.

The CHILDHOOD of the WORLD: a Simple Account of Man in Early Times By EDWARD CLODD, F.R.S.

"This gem all little volumes is a child's book as to shortness, clearness, and simplicity of style, though the author occasionally hopes that older people will use it as a source of information not so popularly accessible elsewhere as to the life of Primitive Man and its relation to our own. This book, if the time has come for the public to take it, will have a certain effect in the world. It is not a mere compilation from the authors mentioned in the Preface, but takes its own ground and stands by itself and for itself. Mr. Clodd has thought out his philosophy of life, and used his best skill to bring it into the range of a child's view."—E. B. TYLOR, F.R.S., in NATURE

"I read your little book with great pleasure. I have no doubt it will do good, and hope you will continue your work. Nothing spoils our temper so much as having to tolerate in youth, manhood, and even old age, so many things, which we were taught as children. A boy like young will prepare a far better soil in the child's mind and I was delighted to have it read to my children."—Letter from Professor MAX MULLER to the Author

MACMILLAN & CO., London.

Just published, 4to, 3s. 6d., Part XII.

RELIQUIÆ AQUITANICÆ, being Contributions to the Archaeology and Palæontology of Périgord and the adjoining Provinces of Southern France, by ADOUF LARTET and HENRY CHRISTY Edited by T. RUSSELL JONES, F.R.S., F.O.S., &c.

To be completed in about 15 Parts (price 3s. 6d. each).

WILLIAMS AND NORRIDGE, 12, Henrietta Street, Covent Garden, London, and 20, South Frederick Street, Edinburgh.

HOLLOWAY'S OINTMENT and PILLS.

—Bilemores and Dyspepsia.—There is no organ in the human body more liable to derangement than the liver. Food, fatigue, climate, and anxiety all disorder its action and render its secretion, the bile, more or less depraved, superabundant, or scanty. The first symptoms should receive attention. A pain in the side, or on the top of the shoulder, a harsh cough and difficulty of breathing, restlessness at night, a burning, dry mouth, furrowed tongue, with morning sweats, are signs of liver disease, which are removed without delay by friction with Holloway's inestimable Ointment over the pit of the stomach and right side. The Pills should be taken without delay. Poor and pauper will alike be cured.

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE.

"To the solid ground
Of Nature trusts the mind which builds for aye"—WORDSWORTH

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, 22, Albemarle street, London, W

The NEXT ANNUAL GENERAL MEETING will be held at
BRADFORD, commencing on Wednesday, September 17

President Designate,

Professor A W WILLIAMSON, Ph.D, F.R.S, F.C.S.,

is the place of J. P. JOYCE, D.C.L., LL.D., F.R.S., who has resigned
the Presidency in consequence of ill health

NOTICE TO CONTRIBUTORS OF MEMOIRS.—Authors are re-
minded that, under an arrangement dating from 1871, the acceptance of
Memoirs, and the days on which they are to be read, are now, as far as
possible, determined by Organising Committees for the several Sections
before the beginning of the Meeting. It has therefore become necessary,
in order to give an opportunity to the Committees of doing justice to the
several communications, that each Author should prepare an Abstract of his
Memorandum, of a length suitable for insertion in the published Transactions of
the Association, and that he should send it, together with the original
Memorandum, by post, on or before September 1, addressed thus:—"General
Secretaries, British Association, 22, Albemarle-street, London, W. For
Section . . ." If it should be inconvenient to the Author that his Paper
should be read on any particular day, he is requested to send information
thereof to the Secretaries in a separate note.

Information about local arrangements may be obtained by application to
the Local Secretaries, Bradford.

G GRIFFITH, M.A., Assistant General Secretary, Harrow

SCHOOL OF CHEMISTRY, 80, GREAT MARLBOROUGH STREET, LONDON, W. DIRECTED BY ARTHUR VACHER, F.C.S.

This Institution is essentially practical, there are no Lectures. Each
Student works independently

The Course of Study is arranged to qualify the Student as an Analyst
and to enable him generally to apply the science to any branch of industry.
But the Students are free to pursue their own particular object.

The hours are from 10a to 4p On Saturdays the Laboratory is re-
served for Ladies

The Charge is Five Pounds per Month. This includes Instruction,
Chemicals, Apparatus, &c. Occasional Students are received at the same
rate, namely, Ten Shillings per Month for each Half-day in the Week.
Schoolmasters requiring personal instruction pay Half-fees.

ROYAL POLYTECHNIC INSTITUTION, 350, REGENT STREET, W

LABORATORY AND CLASS ROOMS are now open on ANALYSES
Pupils and Class and Private Studies Investigations connected with
Practical Conducted. Classes are now forming in Chemistry, Physics,
and Steam.—For Fees and Syllabus apply to the Professor of Chem-
istry, Scientific Department, Royal Polytechnic Institution.

OPEN SCHOLARSHIPS WITHOUT EXAMINATION

The Hibbert Trustees are prepared to grant, at their Meeting in Decem-
ber next, One or more Scholarships of £200 per annum each, for two years,
to Graduates of any University in Great Britain and Ireland, between the
ages of twenty-one and twenty-eight, to enable them to study Theology and
Mental and Moral Philosophy at Universities in Germany, Holland, or
Switzerland (or elsewhere), subject to the approval of the Trustees.
Full particulars may be obtained of the Secretary, to whom applications
for Scholarships must be forwarded before October 1, 1873

A H PAGET, Secretary

University Hall, Gordon Square, W C

ROYAL COUNCIL OF EDUCATION.—

The Laboratory and Class-rooms of BERNERS COLLEGE are open for
Pupils EVERY DAY and EVENING. The subjects of the above
Examinations can be studied either Privately or in Classes. Fees
moderate. Analyses and investigations conducted.—Apply to Prof.
E V GARDNER, F.R.S, F.S.A., 44, Berners Street, W.

A GENTLEMAN, having completed Systematic Courses of Study under Professors Percy, Smyth, Goodrich,
Frankland, Valentine, Huxley, Goltz, and Edgar, having taken the
Double Associateship of the Royal School of Mines, also being ex-
perienced in Laboratory Teaching and Science Lecturing, wishes to meet
with an Engagement in connection with a College or Science Schools.—
Address—Hermes, 139, Fulham Road, South Kensington, London

PEVERIL OF THE PEAK Price 6d.

A HANDBOOK TO CASTLETON AND NEIGHBOURHOOD, Antiquities, Geology, Natural Features, &c

Editor—J C BATES. Castleton: J TYM

DRAPER'S INK (DICHROIC).

THE NEW BLACK INK

DIFFERING FROM ANYTHING ELSE EVER PRODUCED.

Writing becomes a pleasure when this Ink is used. It has been adopted
by the principal Banks, Public Offices, and Railway Companies throughout
Ireland

It writes almost instantly Full Black
Does not corrode Steel Pens.
Is cleanly to use, and not liable to
Bleed.

Flows easily from the Pen
Blotting-paper may be applied at the
moment of writing.

TO BE HAD OF ALL STATIONERS.

BEWLEY AND DRAPER, DUBLIN

MACMILLAN & CO'S PUBLICATIONS.

This day, in Crown 8vo, price 3s. 6d.

THE SPECTROSCOPE and its APPLICATIONS By J. Norman Lockyer, F.R.S. With Coloured Plate and numerous Woodcuts. Being Vol I of "NATURE SERIES," a Series of Popular Scientific Works now in course of Publication.

THE DEPTHS OF THE SEA: an Account of the General Results of the Dredging Cruises of H.M.S. *Porcupine* and *Typhoon* during the Summers of 1868, 1869, and 1870, under the Scientific Direction of Dr Carpenter, F.R.S., J. Gwyn Jeffreys, F.R.S., and Dr. Wyville Thomson, F.R.S. By Dr. WYVILLE THOMSON, F.R.S., Director of the Scientific Staff of the *Challenger Expedition*. In 8vo, cloth, extra gilt, with nearly 100 Illustrations and 8 Coloured Maps and Plans, price 31s. 6d.

"Nothing can be more complete than the account of the scientific results of these voyages, which are fully illustrated by woodcuts of the strange forms of life brought from the dark depths of the ocean, by charts of soundings, and elaborate tables of deep-sea temperature."—*Daily News*.

"Looking at the engravings, it is not too much to say that no such illustrations of the peculiarly delicate and complicated forms of lower animal life have yet appeared."—*Times*.

THE FORCES OF NATURE A Popular Introduction to the Study of Physical Phenomena. By ANDEE GULJ EMIN. Translated from the French by Mr. NORMAN LOCKYER, and Edited, with Additions and Notes, by J. NORMAN LOCKYER, F.R.S. Illustrated by 11 Coloured Plates and 455 Woodcuts. Second Edition. Royal 8vo, Cloth extra, 31s. 6d.

"Translator and editor have done justice to their trust. The text has all the force and flow of original writing, combining faithfulness to the author's meaning with purity and independence in regard to idiom, while the technical precision and accuracy pervading the work throughout speak of the watchful editorial supervision which has been given to every scientific detail. Altogether, the work may be said to have no parallel, either in point of fulness or attraction, as a popular manual of physical science."—*Saturday Review*.

Third Edition of PROFESSOR ROSCOE'S LECTURES on the SPECTRUM ANALYSIS Revised throughout, with Appendixes, Engravings, Maps, and Chromo-Lithographs of the Spectra of the Chemical Elements and Heavenly Bodies. Medium 8vo, Cloth extra, 21s.

THE LIFE and LETTERS of JAMES DAVID FORBES, F.R.S., late Principal of the United College in the University of St. Andrews. By J. CAMPBELL SHAPIRO, LL.D., Principal of the United College in the University of St. Andrews, PROFESSOR TAIT, University of Edinburgh, and A. ADAMS-REILLY, F.R.G.S. With Portraits, Map, and Illustrations. 8vo, 16s.

"Not only a biography which all should read, but a scientific treatise without which the shelves of no physicist's library can be deemed complete."—*Standard*.

PROFESSOR HUXLEY'S CRITIQUES and ADDRESSES. 8vo, 10s. 6d.

CONTENTS.—Administrative Nihilism. The School Boards what They Can Do and what They May Do. On Medical Education. Yeast. On the Formation of Coal. On Coral and Coral Reefs. On the Methods and Results of Ethnology. On some Fixed Points in British Ethnology. Paleontology and the Doctrine of Evolution. Biogenesis and Abiogenesis. Mr. Darwin's Critics. The Genealogy of Animals. Bishop Berkeley and the Metaphysics of Sensation.

(By the same Author—LAY SERMONS, ADDRESSES, AND REVIEWS. New and Cheaper Edition. Crown 8vo, 7s. 6d.)

THE CONFLICT of STUDIES; and other Essays on Subjects connected with EDUCATION. By ISAAC TODHUNTER, M.A., F.R.S., late Fellow and Principal Mathematical Lecturer of St. John's College, Cambridge. 8vo, 10s. 6d.

CONTENTS.—The Conflict of Studies—Competitive Examinations—Private Study of Mathematics—Academical Reform—Elementary Geometry—The Mathematical Tripos.

THE CHILDHOOD of THE WORLD. A Simple Account of Man in Early Times. By EDWARD CLODD, F.R.S. Second Edition. Crown 8vo, 3s.

Prof. Max Müller, in a letter to the Author, says.—"I read your book with great pleasure. I have no doubt it will do good, and I hope you will continue your work. Nothing spoils our temper so much as having to unlearn in youth, manhood, and even old age, so many things which we were taught as children. A book like yours will prepare a far better soil in the child's mind, and I was delighted to have it to read to my children."

THE BEGINNINGS of LIFE: Being some Account of the Nature, Modes of Origin, and Transformations of Lower Organisms. By H. CHARLTON BASTIAN, M.D., F.R.S. With upwards of 100 Illustrations. 2 vols, crown 8vo, 28s.

ON the GENESIS of SPECIES. By St. George Mivart, F.R.S. Second Edition, to which Notes have been added in reference and reply to Darwin's "Descent of Man." With numerous Illustrations. Crown 8vo, 9s.

E. DENT & CO., 61, Strand, & 34, Royal Exchange.

THE

JOURNAL OF APPLIED CHEMISTRY.

A MONTHLY PUBLICATION OF 16 PAGES QUARTO.

Devoted to Chemistry as applied to Arts and Manufactures, Agriculture,
Metallurgy, &c. &c.

At Two Dollars and Twenty-five Cents per annum, or One Dollar and
Seventy-five Cents paid strictly in advance, including postage to United
Kingdom.

Each number contains Original Articles on General Chemistry applied to
Arts and Manufactures. Matter on Particular Fabrications, as Petroleum,
Soap, Tanning, Dyeing, and numerous others.

A valuable space is also devoted to Practical Recipes and interesting Scientific
Facts.
Full and carefully prepared Market Reviews and Prices Current of Drugs
and Chemicals of every description are given in each number for New
York, Boston, and Philadelphia, with Tables of Imports.

EIGHTH VOLUME, commenced with January number.

DEXTER & CO, PUBLISHERS,

HOLLOWAY'S OINTMENT AND PILLS.

—Dysuria, Bowel Complaints—The hot weather, defective drainage, and noxious vapours arising from decomposing animal and vegetable matter, are now producing an unusual amount of sickness, which should have early attention. In all complaints affecting stomach, liver, or bowels, Holloway's Ointment is a most satisfactory agent when diligently rubbed upon the abdomen. It penetrates to the seat of evil, and soon removes the causes of indigestion and flatulency, which should warn us of approaching disease. It is safer, in urgent cases, to take the Pills than the Ointment, as both will together act more energetically. A few days of this treatment will stop every case of bowel complaint in its early stage or acute form.

RUPTURES.—BY ROYAL LETTERS PATENT

WHITE'S MOC-MAIN LEVER TRUSS

It is allowed by upwards of 500 Medical Men to be the most effective invention in the curative treatment of Hernia. The use of a steel spring, so often hurtful in its effects, is here avoided, a soft bandage being worn round the body, while the requisite pressure is supplied by the use of the MOC-MAIN PAD and PATENT LEVER, being with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fail to fit) forwarded by post, on the circumstance of the body, 1 inches below the hips, being sent to the manufacturer,

JOHN WHITE, 281, Piccadilly.

Price of a single Truss, 16s., 22s., 26s., 32s., and 38s. 6d.
"Double" 31s. 6d., 40s., 48s., and 56s. 6d. Post-free
Unbilled 4s. and 5s. 6d.

ELASTIC STOCKINGS, KNEE-CAPS, &c., for the cure of Weakness, and Swelling of the legs, Sprains, &c. They are porous, light, and waterproof, and draw on over an ordinary stocking. Price 4d. 6d., 7s. 6d., 10s., and 12s. each. Postage free.

EIGHTH VOLUME, commenced with January number
 DEWEY & CO, PUBLISHERS,

Spence Street, New York 48, Haver Street, Boston, and 149, South 4th Street, Philadelphia, P.A., U.S.A.

HOLLOWAY'S PILLS.—Broken Health.

It is lamentable to look around us, and many lingering under diseases through ignorance, carelessness, or false ideas of medicine. Nothing can be more reasonable, nothing more easy, under such circumstances, than to give a fair trial to the process of purifying our system, and best of stomach tonic. The blood is vitiated in only one instance, by the process of a fair appetite and good digestion, indeed, the purity of that fluid is the direct measure of corporal and mental vigour. Holloway's Pills effect both these ends with uniform safety and certainty, by sustaining the appetite, and enforcing digestion. Holloway's Pills preserve the sweetness and freshness of life, enrich and cleanse the system, and clear the blood.

Second Edition, crown 8vo, 3s.

The CHILDHOOD OF THE WORLD: a Simple Account of Man in Early Times. By EDWARD LLOYD, F.R.S.

"This general little volume is a child's book as to shortness, cheapness, and simplicity of style, though the author so wisely hopes that a like people will use it as a source of information not popularly accessible elsewhere as to the life of Primitive Man and its relation to our own. This book if the time has come for the public to take to it, will have a certain effect in the world. It is not a mere compilation from the authors mentioned in the preface, but takes its own ground and stands by itself and for itself. Mr. Lloyd has thought out his philosophy of life and used his best skill to bring it into the range of a child's view. — *The Times*, F.R.S., in NATURE."

"I read your little book with great pleasure. I have no doubt it will do good, and hope you will continue your work. Nothing speaks out temper so much as having to unlearn in youth, and even old age, so many things which were taught us as children. A few like yours will prepare a far better soil in the child's mind and we are delighted to have it to read to my children." — *Letter from Professor Max Müller to the Author*

THE CONFLICT of STUDIES, and other Essays on Subjects connected with EDUCATION. By ISAAC DOUBLINTER, M.A., F.R.S., late Fellow and Principal Mathematical Lecturer of St. John's College, Cambridge. 8vo, 10s. 6d.

CONTENTS.—The Conflict of Studies—Competitive Examinations—Private Study of Mathematics—Academical Reform—Elementary Geometry—The Mathematical Tripos.

THE CHILDHOOD OF THE WORLD. A Simple Account of Man in Early Times. By EDWARD CLODD, F.R.A.S. Second Edition. Crown 8vo, 3s.

Prof. Max Müller, in a letter to the Author, says,—"I read your book with great pleasure. I have no doubt it will do good, and I hope you will continue your work. Nothing spoils our temper so much as having to mature in youth, manhood, and even old age, so many things which we were taught as children. A book like yours will prepare a far better soul in the child's mind, and I was delighted to have it to read to my children."

THE BEGINNINGS of LIFE: Being some Account of the Nature, Modes of Origin, and Transformations of Lower Organisms. By H. CHARLTON BASFORD, M.D., F.R.S. With upwards of 100 Illustrations. 2 vols, crown 8vo, 28s.

ON the GENESIS of SPECIES. By St. George Mivart, F.R.S. Second Edition, to which Notes have been added in reference and reply to Darwin's "Descent of Man." With numerous Illustrations. Crown 8vo, 9s.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, 22, ALBEMARLE STREET, LONDON, W

The NEXT ANNUAL GENERAL MEETING will be held at
BRADFORD, commencing on Wednesday, September 17

President Designate,

Professor A W WILLIAMSON, Ph D, F.R.S., F.C.S.,

In the place of J. P. JOULE, D.C.L., LL.D., F.R.S., who has resigned
the Presidency in consequence of ill health.

NOTICE TO CONTRIBUTORS OF MEMOIRS.—Authors are re-
minded that, under an arrangement dating from 1851, the acceptance of
Memoirs, and the days on which they are to be read, are now, as far as
possible, determined by (nominating) Committees for the several sections
before the beginning of the Meeting. It has therefore become necessary,
in order to give an opportunity to the Committees of doing justice to the
several communications, that each Author should prepare an Abstract of his
Memorandum, or a length suitable for insertion in the Proceedings of the
Association, and that he should send it, together with the original
Memorandum, by post not on or before September 1, addressed thus:—"General
Secretaries, British Association, 22, Albemarle-street, London, W. For
Section . . ." If it should be inconvenient to the Author that his Paper
should be read on any particular day, he is requested to send information
thereof to the Secretaries in a separate note.

G GRIFFITH, M.A., Assistant General Secretary, Harrow

ROYAL POLYTECHNIC INSTITUTION, 309, REGENT STREET, W

LABORATORY AND CLASS ROOMS are now open or ANALYSES
Pupils and Class and Private Studies Investigations connected with
Patents Conducted. Classes are now forming in Chemistry, Physics,
and Steam.—For Fees and Syllabus apply to the Professor of Chemis-
try, Scientific Department, Royal Polytechnic Institution.

ROYAL COUNCIL OF EDUCATION.—

The Laboratory and Class-rooms of BERNERS COLLEGE are open for
Pupils EVERY DAY and EVENING. The subjects of the above
Examinations can be studied either Privately or in Classes. Fees
moderate. Analyses and investigations conducted.—Apply to Prof
E. V. GARDNER, F.R.S., F.S.A., 44, Berners Street, W.

MEDICAL EDUCATION

ST. MARY'S HOSPITAL MEDICAL

SCHOOL will open on Wednesday, October 23, 1873, with an Intro-
ductory Address by Dr. SHERRARD, at 8 p.m.
The Prospectus, containing full information with regard to the Spec-
ial System of Instruction, and the Scholarships, Prizes, and Appointments may
be obtained on application to Mr. KNOT, the Registrar at the Hospital,
or to

W. B. CHEADLE, M.D., *Dean of the School.*

UNIVERSITY COLLEGE, LONDON.

FACULTY OF SCIENCE

The Session will begin on Thursday, October 3, 1873

Pure Mathematics—Professor C. HERMITE, Ph.D.

Applied Mathematics and Mechanics—Professor W. K. CLIFFORD, M.A.

Physics—Professor G. C. LIVING, F.R.S., F.C.S.

Chemistry and Practical Chemistry—Professor WILLIAMSON, Ph.D.

Mineralogy and Geology—Professor MORSE, F.G.S.

Engineering—Professor GEORGE FULMER, C.E.

Architecture and Construction—Professor J. HAYTER LAWIS, F.S.A.

Physiology—Professor OWEN, F.R.S., F.C.S.

Comparative Anatomy and Zoology—Professor GRANT, M.D., F.R.S.

Physiology—Professor SHANNON, M.D., LL.D., F.R.S.

Practical Physiology and Logic—Professor RUDOLPH SANDERSON, M.D., F.R.S.

Philosophy of Mind and Logic—Professor G. CROUCH ROBERTSON, M.A.

Political Economy—Professor L. H. LOUGHERY, M.A.

A Prospectus of the Faculty may be obtained at the Office of the College.

The Examinations for the Andrews Entrance Prize will be held at the

College on the 25th and 26th of September.

The College is close to the Gower Street Station of the Metropolitan Rail-
way.

JOHN ROBSON,

Secretary to the Council

NOTICE.—ROYAL SCHOOL OF MINES,

Jermyn Street, London.—The 3rd Session will begin on Wednesday,
the 1st October. Prospectuses may be had on application.

TRENHAM REEKS, Registrar

REQUIRED by a FELLOW of the LIN-

NEAN and Zoological Societies, holding Certificate in Biology from
the Royal School of Mines, sometime Assistant in the Museum of the
Royal College of Surgeons, London, and the British Museum, and late
Curator of the Brighton Aquarium, an Engagement in England, Amer-
ica, or the Colonies, as Curator or Assistant-Curator to a Museum, or
as Manager of an Aquarium. High-class Educational Acquirements.
W. Saville Kent, Naturalist Office, London.

JUNIOR ASSISTANT FOR PHOTOGRA- PHIC and Spectroscopic Observations in the Royal Observatory,

Greenwich.
An Open Competition for one Situation will be held in London on Tues-
day, September 30th, and following days.

A Preliminary Examination will be held at London, Edinburgh, and Dub-
lin, on Tuesday, September 16th.

Limits of age—23 and 25. Applications for the Regulations and the neces-
sary Form should be made at once to the Secretary, Civil Service Commis-
sion, Cannon Row, London, S.W.

Just ready, in crown 8vo, cloth, price 3s. 6d.

THE SPECTROSCOPE AND ITS APPLICATIONS

BY J. NORMAN LOCKYER, F.R.S.

WITH A COLOURED PLATE AND NUMEROUS WOODCUTS.

Being VOLUME ONE of "NATURE SERIES," a Series of Popular Scientific Works now in course of publication.

MACMILLAN & CO., London

WORKS BY SIR SAMUEL BAKER, F.R.G.S.

THE NILE TRIBUTARIES of ABYSSINIA and the SWORD HUNTERS of the HAMRAN ARABS Fourth and cheaper Edition, with numerous Illustrations and Maps. Crown 8vo, 6s.

The Times says:—"It solves finally a geographical riddle which hitherto had been extremely perplexing, and it adds much to our information respecting Egyptian Abyssinia and the different races that spread over it. It contains, moreover, some notable instances of English daring and enterprising skill, it abounds in animated tales of exploits dear to the heart of the British sportsman, and it will attract even the least studious reader, as the author tells a story well, and can describe nature with uncommon power."

THE ALBERT N'YANZA GREAT BASIN of the NILE, and EXPLORATION of the NILE SOURCES Third and cheaper edition, with numerous Illustrations and Maps. Crown 8vo, 6s.

"The author, while he equals other African explorers in judgment and daring, far exceeds them in literary capacity. He has produced two volumes which can be read straight through with ease and pleasure."—*Guardian*

"Charmingly written, full—as might be expected—of incident, and free from that wearisome reiteration of useless facts which is the drawback to almost all books of African travel."—*Spectator*.

MACMILLAN AND CO., London.

RICHARD PROCTOR, THE ASTRONOMER

With Original Portrait, and Post-Memorandum written, see the *Illustrated Review* for August 28th. Price 2d. Office, 59, Fleet Street.

HOLLOWAY'S OINTMENT and PILLS

Unwholesome Changes—the changeable weather is causing much sickness and exerting the most deleterious influence in deranging the secretions of the body. Alternating chills and heats so derange the capillary circulation that the liver, stomach, or lungs must become disordered. Holloway's Ointment well rubbed over these organs twice a day provides the quickest, safest, and best curative. It penetrates the skin, enters the deeper structures, purifies their blood, cleanses their surface, equalises their circulation, and renders their secretions abundant, without annoying, irritating, or exhausting the weakest or most delicate invalid. Colds, coughs, influenza, and other chest complaints originating in damp, variable seasons, are checked in their debilitating careers and cured by Holloway's remedies.

Second Edition, crown 8vo, 3s.

The CHILDHOOD of the WORLD: a Simple Account of Man in Early Times. By EDWARD CLODD, F.R.S.

"This little volume is a child's book as to shortness, cheapness, and simplicity of style, though the author reasonably hopes that older people will use it as a source of information not popularly accessible elsewhere as to the life of Primitive Man and its relation to our own. This book, if the time has come for the public to take to it, will have a certain effect on the world. It is not a mere compilation from the authors mentioned in the preface, but takes its own ground and stands by itself and for itself. Mr. Clodd has thought out his philosophy of life, and used his best skill to bring it into the range of a child's view."—B. J. LYTTON, F.R.S., in *NATURE*.

"I read your little book with great pleasure. I have no doubt it will do good, and hope you will continue your work. Nothing spoils our temper so much as having to quarrel with youth, manhood, and even old age, so many things, which we were taught as children. A book like yours will prepare a far better soil in the child's mind, and I was delighted to have it so read to my children."—Letter from Professor MAX MÜLLER to the Author.

MACMILLAN & CO., London.

In the Press

THE ELEMENTS OF EMBRYOLOGY.

By MICHAEL FOSTER, M.A., F.R.S.,
Professor in Physiology at Trinity College, Cambridge, and
F. M. BALFOUR, Scholar of Trinity College, Cambridge.
MACMILLAN & CO., London.

"THE GARDEN,"

A Weekly Illustrated Journal Devoted solely to Horticulture in all its branches.

THE GARDEN is conducted by WILLIAM ROBINSON, F.L.S., Author of "Hardy Flowers," "Alpine Flowers for English Gardens," "The Parks, Promenades, and Gardens of Paris," &c., and the best Writers in every department of Gardening are contributors to its pages.

The following are some of the subjects regularly treated of in its pages:—
The Flower Garden Hardy Flowers.
Landscape Gardening Lawn Gardens.
The Fruit Garden The Conservatory.
Garden Structures Public Gardens.
Kiosks and Window Gardens The Greenhouse and Stove.
Notes and Queries The Household.
Market Gardening The Wild Garden.
Trees and Shrubs The Kitchen Garden.

THE GARDEN may be obtained through all Newsagents and at the Railway Bookstalls, at 4d. per copy. It may also be had direct from the Office at 5s. for a Quarter, or 9s. 6d. for a Half-year, and 17s. 6d. for a Year, payable in advance, and in Monthly Parts. Specimen Copies (post-free), 4d.

37, Southampton Street, Covent Garden, W.C.

THE ONLY CHEAP FARMERS' NEWSPAPER.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE.

Edited by JOHN ALGERNON CLARKE, Secretary to the Central Chamber of Agriculture.

Devotes special attention to the discussions and proceedings of the Chambers of Agriculture of Great Britain (which now number upwards of 15,000 members), besides giving original papers on practical farming and a mass of intelligence of particular value to the agriculturist.

The London Corn, Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to insure delivery to country subscribers by the first post on Tuesday morning. Price 3s. 6d. or prepaid, 15s. a year post free.

Published by W. PICKERING, 21, Abchurch Lane, Strand, W.C.

MACMILLAN & CO'S PUBLICATIONS.

This day, in Crown 8vo, price 3s. 6d.

THE SPECTROSCOPE and its APPLICATIONS. By J. Norman Lockyer, F.R.S.
With Coloured Plate and numerous Woodcuts. Being Vol. I of "NATURE SERIES," a Series of Popular Scientific Works now in course of Publication.

THE DEPTHS OF THE SEA. an Account of the General Results of the Dredging Cruises of H.M.S. *Porpoise* and *Lightning* during the summers of 1868, 1869, and 1870, under the Scientific Direction of Dr. Carpenter, F.R.S., J. Gwyn Jeffreys, F.R.S., and Dr. Wyville Thomson, F.R.S. By Dr. WYVILLE THOMSON, F.R.S., Director of the Scientific Staff of the *Challenger* Expedition. In 8vo, cloth, extra gilt, with nearly 100 Illustrations and 8 Coloured Maps and Plans, price 31s. 6d.

"Nothing can be more complete than the account of the scientific results of these voyages, which are fully illustrated by woodcuts of the strange forms of life brought from the dark depths of the ocean, by charts of soundings, and elaborate tables of deep-sea temperature."—*Daily News*

"Looking at the engravings, it is not too much to say that no such illustrations of the peculiarly delicate and complicated forms of lower animal life have yet appeared."—*Times*

The FORCES of NATURE. A Popular Introduction to the Study of Physical Phenomena. By AMÉDÉE GUILLEMIN. Translated from the French by Mrs. NORMAN LOCKYER, and Edited, with Additions and Notes, by J. NORMAN LOCKYER, F.R.S. Illustrated by 11 Coloured Plates and 455 Woodcuts. Second Edition. Royal 8vo, Cloth extra, 31s. 6d.

"Translator and editor have done justice to their trust. The text has all the force and flow of original writing, combining faithfulness to the author's meaning with purity and independence in regard to idiom, while the technical precision and accuracy pervading the work throughout speak of the watchful editorial supervision which has been given to every scientific detail. Altogether, the work may be said to have no parallel, either in point of fulness or attraction, as a popular manual of physical science."—*Saturday Review*.

Third Edition of PROFESSOR ROSCOE'S LECTURES on the SPECTRUM ANALYSIS. Revised throughout, with Appendices, Engravings, Maps, and Chromo-Lithographs of the Spectra of the Chemical Elements and Heavenly Bodies. Medium 8vo, Cloth extra, 21s.

THE LIFE and LETTERS of JAMES DAVID FORBES, F.R.S., late Principal of the United College in the University of St. Andrews. By J. CAMPBELL SHAIRP, LL.D., Principal of the United College in the University of St. Andrews, PROFESSOR TAIT, University of Edinburgh, and A. ADAMS-REILLY, F.R.G.S. With Portraits, Map, and Illustrations. 8vo, 16s.

"Not only a biography which all should read, but a scientific treatise without which the shelves of no physicist's library can be deemed complete."—*Standard*

- 8 Physics By Frederick Guthrie, Ph.D. F.R.S.
- 9 Mechanical Drawing By Rev. J. H. Eglar, M.A.

The Fee for Students desirous of becoming Associates is £30 in one sum, on entrance, or two annual payments of £20, exclusive of the Laboratories. Pupils are received in the Chemical Laboratory, under the direction of Dr. Frankland, and in the Metallurgical Laboratory, under the direction of Dr. Percy. These Laboratories will be reopened on October 1st.

Tickets to separate Courses of Lectures are issued at £3 and £4 each. Officers in the Queen's Service, Her Majesty's Consuls, Acting Mining Agents, and Managers may obtain Tickets at reduced prices. Science Teachers are also admitted to the Lectures at reduced fees. His Royal Highness the Prince of Wales grants Two Scholarships, and several others have also been established by Government.

For a prospectus and information apply to the Registrar, Royal School of Mines, Jermyn Street, London, S.W.

TRENTHAM REEKS, Registrar

NOTE.—By order of the Lords of the Committee of Council on Education the instruction in Chemistry, Physics, Applied Mechanics, and Natural History will be given in the New Building, in the Exhibition Road, South Kensington.

SCIENCE TUITION BY CORRESPONDENCE.—Mr. ROUTLEDGE, B.Sc. F.C.S., Bowdoin, Cheshire

REQUIRED by a FELLOW of the LINNEAN and Zoological Societies, holding Certificate in Biology from the Royal School of Mines, sometimes Assistant in the Museum of the Royal College of Surgeons, London, and the British Museum, and Late Curator of the Brighton Aquarium, an Engagement in England, America, or the Colonies, as Curator or Assistant-Curator to a Museum, or as Manager of an Aquarium. High class Testimonials. Address—W. Saville Kent, Natural Office, London.

THE OWENS COLLEGE,

MANCHESTER

The SESSION 1873-4 will be opened in the New Buildings in Oxford Road

PRINCIPAL J G GREENWOOD, B A

PROFESSORS AND LECTURERS

Greek	Professor J G GREENWOOD B A (Fellow of University College, London)
Latin	Professor A S WILKINS, M A (Fellow of University College, London)
Comparative Philology	Assistant Lecturer in Greek and Latin— Mr EDWIN B ENGLAND, M A
English Language and Literature	Professor A W WARD, M A (Fellow of St Peter's College, Cambridge)
Ancient and Modern Hist.	Mr THOS N TOLLER, M A (Fellow of Christ's College Cambridge)
Mathematics	Professor THOMAS BARKE R, M A (Fellow of Trinity College, Cambridge)
Natural Philosophy	Assistant Lecturer— Mr A T BENTLEY, M A
Physical Laboratory	Professor BALFOUR STEWART, M A ILD FRS
Civil and Mechanical Engineering	Professor THOMAS H CORB, M A Demon (Mr J KINGDON, FRS)
Geometrical and Mechanical Drawing	Assistant—Mr JOHN B MILLAR, B A (Fellow of Queen's College, Cambridge)
Logic and Mental Philosophy	Professor W STANLEY JEVONS, M A FRS (Fellow of University College, London)
Political Economy	Professor JAMES BRUCE, D CL (Fellow of University College, Oxford)
Jurisprudence and Law	Mr T E HOLLAND, M A BCL (Fellow of Exeter College, Oxford)
	Ditto—Mr J B GUNNING MOORE, M A Ditto—Mr WM R KENNEDY, M A (Fellow of Pembroke College, Cambridge)
Chemistry	Professor H F ROSCOF, B A PhD FRS
Chemical Laboratory	Senior Demonstrator— Mr C SCHORLEMMER, FRS Junior Demonstrator and Assistant Lecturer— Mr W DITMAR, FRS Assistant Demonstrator (Mr W C WILLIAMS, FRS)
Organic Chemistry	Assistant Lecturer— Mr C SCHORLEMMER, FRS
Animal Physiology and Zoology	Professor W C WILLIAMSON, FRS
Vegetable Physiology and Botany	
Physiolog. Physiology and Histology	Professor ARTHUR GAMGEE, M D FRS
Geology and Palaeontology	Lecturer—Mr W BOYD DAWKINS, M A FRS FGS
Mineralogy	Lecturer—Mr CHAS A BURGHARDT, PhD
Oriental Languages	Professor I THEODORES
German and Italian	Lecturer—Mr HERMANN BREYMANN, PhD
French Language and Literature	Lecturer—Mr WILLIAM WALKER
Free Hand Drawing	Lecturer—Mr FREDK BRIDGE, Mus B
Harmony and Musical Composition	

The Next Session commences on the 10th October
Candidates for Admission must not be under fourteen years of age, and those under sixteen will be required to pass a preliminary examination in English, Arithmetic, and the elements of Latin
Prospectuses of the several Departments of the Day Classes, the Evening Classes, and the Medical School, and of the Scholarships and Entrance Examinations tenable at the College, will be sent on application

J HOLME NICHOLSON, Registrar.

"THE GARDEN,"

A Weekly Illustrated Journal Devoted Solely to Horticulture in all its branches.

THE GARDEN is conducted by WILLIAM ROBINSON, F.L.S., Author of "Hardy Flowers," "Alpine Flowers for English Gardens," "The Parks, Promenades, and Gardens of Paris," &c., and the best Writers in every department of Gardening are contributors to its pages.

The following are some of the subjects regularly treated of in its pages—

- | | |
|--------------------------|--------------------------|
| The Flower Garden | Hardy Flowers. |
| Landscape Gardening | Town Gardens |
| The Fruit Garden | The Conservatory |
| Garden Structures | Public Gardens |
| Room and Window Gardens. | The Greenhouse and Stove |
| Notes and Questions | The Household |
| Market Gardening | The Wild Garden |
| Trees and Shrubs. | The Kitchen Garden |

THE GARDEN may be obtained through all Newspapers and at the Railway Bookstalls, at 4d per copy. It may also be had direct from the Office at 5s for a Quarter, or 5s for a Half-year, and 10s 6d for a Year, payable in advance, and in Monthly Parts. Specimen Copies (post-free), 4d.

37, Southampton Street, Covent Garden, W.C.

RUPTURES,—BY ROYAL LETTERS PATENT

WHITE'S MOC-MAIN LEVER TRUSS

is allowed by upwards of 500 Medical Men to be the most effective invention in the curative treatment of Hernia. The use of a steel spring, so often hurtful in its effects, is here avoided, a soft bandage being worn round the body, while the requisite retaining power is supplied by the MOC-MAIN FAULT and PATENT LEVER, fitting with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fail to be) forwarded by post, on the circumference of the body, a inches below the hips, being sent to the manufacturer,

JOHN WHITE, 228, Piccadilly

Price of a single Truss, 10s, 12s, 15s, 20s, 25s, 30s, and 35s 6d. Post-free. Double " 31s 6d, 42s, 50s, and 55s 6d. Unimpaired 10s, and 12s 6d.

ELASTIC STOCKINGS, KNEE-CAPS,

&c., for Varicose Veins and all cases of Weakness, and Swelling of the legs, Sprains, &c. They are porous, light in texture, and inexpensive, and drawn 75 over an ordinary stocking. Price 4d, 6d, 7s 6d, 10s, and 12s each. Postage free.

JOHN WHITE, Manufacturer, 228, Piccadilly, London.

Price 2s

AUNT RACHEL'S LETTERS ABOUT

WATER AND AIR. A few facts about heat in relation to these substances told in simple language.

"In all respects to be commended as a book to be put into the hands of the young."—*Nature*
"From the nature case which has been taken to make the statements strictly to accord with facts ascertained at the date of publication, the young reader will have no more to unlearn hereafter than if he studied the most expensive and approved volumes by the recognised authorities of the day."—*Scientific Review*

London: LONGMANS, GREEN, & CO., Paternoster Row.

DRAPER'S INK (DICHROIC).

THE NEW BLACK INK

DIFFERING FROM ANYTHING ELSE EVER PRODUCED

Writing becomes a pleasure when this Ink is used. It has been adopted by the principal Banks, Public Offices, and Railway Companies throughout Ireland.

It writes almost instantly Full Black. Does not corrode Steel Pens. Is cleanly to use, and not liable to blot.

Flows easily from the Pen. Blotting paper may be applied at the moment of writing.

TO BE HAD OF ALL STATIONERS

BEWLEY AND DRAPER, DUBLIN.

MR. TENNANT, GEOLOGIST,

149, STRAND, LONDON, W.C.

GIVES INSTRUCTION IN MINERALOGY AND GEOLOGY, and can supply the necessary Collections of Minerals, Rocks and Fossils, to illustrate the Works of Aucted Buckland, Lyell, Jukes, &c., and others, on the following terms:

- | | |
|--|--------|
| 100 Small Specimens, in Cabinet, with Three Trays | £2 3 0 |
| 200 Specimens, larger, in Cabinet, with Five Trays | 5 0 0 |
| 300 Specimens, larger, in Cabinet, with Eight Trays | 10 0 0 |
| 400 Specimens, larger, in Cabinet, with Twelve Trays | 21 0 0 |
- More extensive Collections, either to illustrate Mineralogy or Geology, at 10 to 500 Guineas each, with every requisite to assist those commencing the study of these interesting branches of Science, a knowledge of which affords as much pleasure to the traveller in all parts of the world as in the more expensive Collections, some of the specimens are rare and all more select.

THE ONLY CHEAP FARMER'S NEWSPAPER.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE,

Edited by JOHN ALGARON CLARKE, Secretary to the Central Chamber of Agriculture.

Devotes special attention to the discussions and proceedings of the Chambers of Agriculture of Great Britain (which now number upwards of 100) and to the leading questions of interest to the farmer, and to the mass of intelligence of particular value to the agriculturist.

The London Cor., Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to insure delivery to country subscribers by the first post on Tuesday morning. Price 3s, or prepaid, 15s a year post free. Published by W. PICKERING, 21, Abchurch Lane, Strand, W.C.

THE ZOOLOGIST.

A MONTHLY JOURNAL OF NATURAL HISTORY

Conducted by EDWARD NEWMAN, F.L.S. F.Z.S. &c.

The *Zoologist* was established in 1843 to record and preserve observations on subjects similar to those treated of in White's "Natural History of the Isle of Man," and the success which has attended it is sufficient proof that its plan is acceptable to "out-of-door naturalists," those who delight in observing the manners, habits, the private lives, the migrations, movements, nests, young and food of animals. It contains original papers and records of facts relating to Quadrupeds, Birds, Reptiles, Fishes, and Insects, together with notices of recent works on every branch of Natural History. The editor has been assisted by more than two hundred of our very best naturalists.

Published on the First of every Month

PRICE ONE SHILLING

NEWMAN'S ENTOMOLOGIST:

A MONTHLY ILLUSTRATED JOURNAL OF BRITISH INSECTS

Conducted by EDWARD NEWMAN, F.L.S. F.Z.S. &c.

Late President of the Entomological Society

The objects of the *Entomologist* are to give every information about Insects, more especially to work out the history of those which attack Fruit and Forest Trees, Vegetables, Root and Seed Crops, Greenhouse and Garden Plants, with a view to suggesting remedies. Notes, Observations, and Queries on every branch of the Science are solicited. To preserve a continuous record of the occurrence of rarities. To improve collections by offering a ready medium for the exchange of specimens.

Published on the First of every Month

PRICE SIXPENCE.

SIMPKIN, MARSHALL, and Co., Stationers' Hall Court.

* Subscriptions for one year, post free, Six Shillings, payable in advance to Edward Newman, 3, Devonshire Street, Bishopsgate. E. Prepayment by the year effectually removes the possibility of irregular delivery by provincial booksellers.

HOLLOWAY'S OINTMENT and PILLS.

—Diseases of the Skin.—No case of disease of the skin, be it its nature
what it may, has failed to be benefited when these potent remedies have
been properly applied. In scurfulous and scorbutic affections they are
especially serviceable. Scurvy and eruptions, which had resisted all
other modes of treatment, and gradually became worse from year to
year, have been completely cured by Holloway's cooling Ointment and
purifying Pills, which root out the disease from the blood itself, and
leave the constitution free from every morbid taint. In the nursery
Holloway's Ointment should be ever at hand, it will give ease in sprains
and contusions, burns, scalds, and infantile eruptions, and may always
safely be employed by any ordinary attendant.

SCIENCE TUITION BY CORRESPON- DENCE.—Mr. ROUTLEDGE, B.Sc. F.C.S., Bowdon, Cheshire.

UNIVERSITY OF DURHAM COLLEGE

OF PHYSICAL SCIENCE, AT NEWCASTLE UPON TYNE

The Session will commence on the 6th October, 1873, and will be divided
into the Michaelmas, Epiphany, and Easter Terms

CLASSES

		Fees	the session
Mathematics	W Steadman Aldis, M.A.	5 2s	"
Physics	A S Herschel, B.A. F.R.S.	5 2s	"
Chemistry	A Treure-Marreco M.A.	5 2s	"
Geology	David Page, LL.D. F.G.S.	5 2s	"
Greek and Latin	Rev J Bulmer, B.D.	5 2s	a term
English History and	Rev J Atkinson, B.A.	2 6s	"
English Literature			
French, German, and			
Mechanical Drawing, each		10s	6d

In addition to the Class Fees, Students will be required to pay an En-
trance Fee of the General. Students who do not enter more than two
Classes may commute this on payment of Seven Shillings for each Class.
Students desirous of studying the whole of the first four subjects may
compound for the class fees by payment of £17 12s. This will be the only
composition fee allowed.

Students entering after the Michaelmas Term will be subjected to a
Matriculation Examination. This will not be obligatory upon those entering
at the commencement of the session.

All Students must have attained the age of 15 years

EVENING CLASSES will be held at 10 former sessions

Further particulars respecting the Examinations, Association of the
College, Laboratory Regulations, Scholarships, Exhibitions, Hours of At-
tendance, &c., will be found in the Prospectus of the College, to be had
free on application to Mr. THOS. WOOD BURNING, Secretary to the
College.

ASSOCIATION of CERTIFYING MEDI- CAL OFFICERS of GREAT BRITAIN and IRELAND

The Sixth ANNUAL GENERAL MEETING will take place at the
Great Northern Hotel, Leeds, on Friday, September 19th, at 11 a.m. Dr
ARLDORE, the President, will deliver the Annual Address. Members of the
Association who intend being present at the Dinner, which will be at 5 p.m.,
are requested to inform the Secretary not later than Tuesday, September
16th, in order that the necessary arrangements may be made. The Secretary
will be glad to give every information respecting the objects of the
Society to those Certifying Medical Officers who have not yet joined the
Association.

Redland, Bristol, Sept. 1st, 1873.

G M STANSFELD, Secretary

ROYAL POLYTECHNIC INSTITUTION,

309, REGENT STREET, W.

LABORATORY and CLASS ROOMS are now open for ANALYSES.
Pupils and Class and Private Studies Investigative connected with
Practical Conducted. Classes are now forming in Chemistry, Physics,
and Steam.—For Fees and Syllabus apply to the Professor of Chemis-
try, Scientific Department, Royal Polytechnic Institution.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

The Forty-Third ANNUAL MEETING of this ASSOCIATION will be held in BRADFORD,

Commencing on WEDNESDAY, September 17, 1873.

President Designate,

PROFESSOR A. W. WILLIAMSON, Ph.D., F.R.S., F.C.S.

Election of Members and Associates

The Executive Committee at Bradford will elect New Members and Associates, on the following conditions:—

I—New Life Members for a composition of £10, which entitles them to receive gratuitously the Reports of the Association which may be published after the date of payment.

II—New Annual Subscribers for a payment of £5 for the first year. They receive gratuitously the Reports for the year of their admission, and for every following year in which they continue to pay a Subscription of £5 without intermission.

III—Associates for this Meeting only for a payment of £1. They are entitled to receive the Report of the Meeting at two-thirds of the publication price. Associates are not eligible to serve on Committees or to hold any office.

Ladies may become Members and Associates on the same terms as Gentlemen. Ladies' Tickets (transferable to Ladies only) may be obtained on payment of £1. Cheques and Post Office Orders to be made payable to Alfred Harris, Junr., Esq., Bradford.

After September 15, personal applications for Tickets must be made at the Reception Room, Bradford, which will be opened on Monday, September 15, at One p.m.

General and Evening Meetings in St. George's Hall

The First General Meeting will be held on Wednesday, September 17, at 8 p.m. precisely, when Dr. Carpenter, LL.D., F.R.S., &c. will resign the Chair, and the President-Elect will assume the Presidency, and deliver an Address. On Thursday Evening, September 18, at 8 p.m., a Discourse on "Phylogeny," September 19, at 8 p.m., a Discourse by Professor W. C. Williamson, F.R.S., of Manchester, on "Coal and Coal Plants," on Saturday Evening, September 20, a Lecture on "Fuel to Working Men only," by Mr. Siemens, F.R.S., on Monday Evening, September 22, at 8 p.m., a Discourse on "Molecules," by Professor Clerk Maxwell, F.R.S., on Tuesday Evening, September 23, at Eight p.m., a Lecture, on Wednesday, September 24, the concluding General Meeting will be held at 8 p.m., in the evening a Grand Concert will be given in St. George's Hall at 8 p.m. EXCURSIONS on Thursday, the 25th September, to the following places of interest have been arranged:—Harrogate, Ripon, Studley, Bolton Abbey, Gordale Scar, Malham, Clapham Tarn, Settle Caves, and Ingleton.

Lists and Prices of Lodgings, and other general information will be given, on application at the Local Secretaries' Office, Bradford.

The names of new LIFE MEMBERS, ANNUAL SUBSCRIBERS, and ASSOCIATES for this Meeting only are now being received and Tickets issued at the Offices of the Association, Market Street, also Tickets for Ladies who do not desire to become Members or Associates: these are transferable to Ladies only.

RICHARD GODDARD, }
PEILE THOMPSON, }

ROYAL COUNCIL OF EDUCATION.—

The Laboratory and Class-rooms of Barning College are open for Pupils EVERY DAY and EVENING. The subjects of the above Examinations can be studied either Privately or in Classes. Free moderate Analysis and Investigations conducted—Apply to Prof. R. V. GARDNER, F.R.S., F.S.A., 44, Barning Street, W.

SCHOOL OF CHEMISTRY, 20, GREAT MARLBOROUGH STREET, LONDON, W.

DIRECTED BY ARTHUR VACHER, F.C.S.

The instruction is essentially practical, there are no Lectures. Each Student works independently.

The Course of Study is arranged to qualify the Student as an Analyst and to enable him generally to apply the science to any branch of industry. But the Students are free to pursue their own particular object.

The hours are from Ten to Four. On Saturdays the Laboratory is reserved for Ladies.

The Charge is Five Pounds per Month. This includes instruction, Chemicals, Apparatus, &c. Occasional Students are received at the same rate, namely, Ten Shillings per Month for each Half-day in the Week. Schoolmasters requiring personal instruction pay Half-fees.

FOR PRICE-LISTS OF MICRO-PHOTOGRAPHIC APPARATUS, Micro-Materials, Microscopic Objects Mounted and Unmounted, address Micro, care of Mr. Latham Chemist, Romford, Essex.

WANTED.—An Assistant Science-Master.

A Gentleman certificated in Chemistry and Physics preferred. Apply—Dr. DAVIES, Central School of Science, Derby.

Will be ready 15th October. Extra fcap 8vo, cloth, price 3s 6d.

THE CHILDHOOD of the WORLD: a
Simple Account of Man in Early Times By EDWARD CLODD,
F.R.S."This general little volume is a child's book as to shortness, cheapness, and
simplicity of style, though the author reasonably hopes that older people will
use it as a source of information not popularly accessible elsewhere as to the
life of Primitive Man and his relation to our own. . . This book, if the
time has come for the public to take to it, will have a certain effect in the
world. It is not a mere compilation from the authors mentioned in the
preface, but takes its own ground and stands by itself and for itself. Mr.
Clodd has thought out his philosophy of life, and used his best skill to
bring it into the range of a child's view."—E. B. TYLOR, F.R.S., in
NATURE."I read your little book with great pleasure. I have no doubt it will do
good, and hope you will continue your work. Nothing spoils our temper so
much as having to unlearn as youth, manhood, and even old age, so many
things which we were taught as children. A book like yours will prepare a
far better soil in the child's mind, and I was delighted to have it to read to
my children."—Letter from Professor MAX MÜLLER to the Author.

MACMILLAN & CO., London.

VICHY WATERS COMPANY,

27, MARGARET STREET, REGENT STREET, LONDON, W.

DEPOT FOR ALL FOREIGN MINERAL WATERS, VICHY.

The use of the Natural Waters of Vichy is extending vastly. They are most efficacious in all complaints arising from acidity. They make the blood more alkaline and less coagulable, and promote its circulation. In the derangement of the digestive functions, and in all the chronic disorders of the abdominal organs, their good effects are shown. The Waters of Vichy are alkaline and gaseous, and although medicinal they are palatable to the palate, from their slightly acid taste. Of all mineral waters they are the most exported.

HOLLOWAY'S OINTMENT and PILLS.

—Culpable Negligence.—At the present time, when the destructive epidemics of 1832 and 1849 are threatening a return, it becomes the paramount duty of all invalids to keep them alive, and their families in full health and vigour. No wound or sore should now be permitted to run its weakening course, nor should one who is inclined to irritate the nervous system, when all such predisposing causes of disease may be effectually removed by this healing Ointment and its use purifying Pills, without enervating or reducing the constitution. Flatulency, diarrhoea, and bilious nausea, soothed by friction with this Ointment upon the abdomen, be dispelled. The Pills will protect against the fell pestilence and keep it at bay.

ROYAL SCHOOL OF MINES.

DEPARTMENT OF SCIENCE, AND ART

During the Twenty-third Session, 1873-4, which will commence on the 1st of October, the following Courses of Lectures and Practical Demonstrations will be given:—

1. Chemistry By E. Frankland, Ph.D. F.R.S.
2. Metallurgy By John Percy, M.D. F.R.S.
3. Natural History By T. H. Huxley, LL.D. F.R.S.
4. Mineralogy } By Warrington W. Smyth, M.A. F.R.S.
5. Mining } *Chairman.*
6. Geology By A. C. Ramsay, LL.D. F.R.S.
7. Applied Mechanics By T. M. Goodwin, M.A.
8. Physics By Frederick Guthrie, Ph.D. F.R.S.
9. Mechanical Drawing By Rev J. H. Edgar, M.A.

The Fee for Students desirous of becoming Associates is £30 in one sum, on entrance, or two annual payments of £20, exclusive of the Laboratories. Pupils are received in the Chemical Laboratory, under the direction of Dr. Frankland, and in the Metallurgical Laboratory, under the direction of Dr. Percy. These Laboratories will be reopened on October 1st. Tickets to separate Courses of Lectures are issued at £3 and £4 each. Officers in the Queen's Service, Her Majesty's Consul, Acting Mining Agents, and Managers may obtain Tickets at reduced prices. Science Teachers are also admitted to the Lectures at reduced fees. His Royal Highness the Prince of Wales grants Two Scholarships, and several others have also been established by Government.

For a prospectus and information, apply to the Registrar, Royal School of Mines, Ferman Street, London, S.W.

NOTE.—By order of the Lords of the Committee of Council on Education, the instruction in Chemistry, Physics, Applied Mechanics, and Natural History will be given in the New Buildings, in the Exhibition Road, South Kensington.

WHITWORTH—SCHOLARSHIPS.—IM-

PORTANT NOTICE.—The important changes in the mode of competing for these Scholarships, and in the conditions of holding them, which come into force at the next competition, have been published. The Revised Rules should be obtained at once, by all who are likely to present themselves for examination, on application to the Secretary, Science and Art Department, South Kensington, London, S.W.

By Order of

THE LORDS OF THE COMMITTEE
OF COUNCIL ON EDUCATION

KING'S COLLEGE

EVENING CLASSES.

Mr. W. N. Hartley gives a course of forty lectures commencing in October, and ending in March, on the General Principles of Chemistry and its application to Manufactures and the useful Arts. Fee £1 12 6d. Monday and Thursday Evenings at 7 o'clock.

The laboratory is open from 7 till 9 on Thursday Evening, when instruction is given in qualitative analysis and to a limited number of students in quantitative work under the direction of Mr. Hartley. Fee £4 6s.

UNIVERSITY COLLEGE, LONDON.

SESSION, 1873-74.

The Session of the Faculty of Medicine will commence on Wednesday, October 1: Introductory Lecture at 3 p.m. by Dr. F. T. Roberts, B.Sc.

The Session of the Faculty of Arts and Laws (including the Department of the Fine Arts), will begin on Thursday, October 2: Introductory Lecture at 4 p.m. by Prof. von O. Heun, Ph.D. Introductory Lecture for the Department of Fine Arts, on Thursday, October 2, at 4.30 p.m., by Professor H. J. Poynter, A.R.A.

The Session of the Faculty of Science (including the Department of the Applied Sciences), will begin on Thursday, October 2.

The Evening Classes for Classics, Modern Languages, Mathematics, and the Natural Sciences, will commence on Monday, October 6.

The School for Boys between the ages of Seven and Sixteen, will be open on Tuesday, September 23.

Prospectuses of the various Departments of the College, containing full information respecting Classes, Fees, Days and Hours of Attendance, &c., and copies of the Regulations relating to the Entrance and other Exhibitions, Scholarships, and Prizes, open to Competition by Students of the several Faculties, may be obtained at the Office of the College.

The Examination for the Medical Entrance Examinations, and also that for the Andrews Entrance Prizes (Faculties of Arts and Laws, and of Science), will be held at the College on 25th and 26th of September.

The College is close to Flower Street Station of the Metropolitan Railway, and only a few minutes' walk from the Terminus of the North-Western, Midland, and Great Northern Railways.

JOHN ROBSON, B.A.,

Secretary to the Council

August, 1873.

UNIVERSITY OF LONDON.

MATRICULATION AND PRELIMINARY SCIENTIFIC EXAMINATIONS

SPECIAL CLASSES for these Examinations are held at St. Bartholomew's Hospital. The Classes are not confined to Students of the Hospital.

A Class for the Matriculation Examination is held twice in each year, from October to January, and from March to June.

A Class for the Preliminary Scientific Examination is held from January to July.

For particulars, applications may be made, personally or by letter, to the Warden of the College, St. Bartholomew's Hospital.

WANTED.—An Assistant Science-Master.

A Gentleman certificated in Chemistry and Physics preferred. Apply
—Dr. Davies, Central School of Science, Derby.

SCIENCE TUITION BY CORRESPONDENCE.—Mr. ROUTLEDGE, B.Sc. F.C.S., Bordon, Cheshire.

MANCHESTER ROYAL SCHOOL OF St. BARTHOLOMEW'S HOSPITAL and MEDICINE, COLLEGE

Incorporated with the OWENS COLLEGE

Principal—J O GREENWOOD, B A

 Midwifery—John Thorneley, M D F R C S
 Accidents—Alex Somers, M R C S
 Jurisic Medicine—W Moyley Henson, M R C S
 Hygiene and Public Health—Arthur Roscoe, M D M A M R C S
 Clinical Medicine—The Physicians to the Royal Infirmary
 Clinical Surgery—The Surgeons to the Royal Infirmary
 Medical Tutor—T Hewick Perkin, M R C S F L S

The WINTER SESSION will commence the 1st October, 1873. The Opening Address will be delivered by Professor GAMGEE, M D F R S. Attendance will be given from 10 to 12, at the College, Oxford Street, up to the 14th October, for registration.

Three Scholarships of the value respectively of £50, £15, and £10, the Practitioner's Scholarship of £25, tenable for two years, and the Dunsville Surgical Prize, value £50, are offered for competition. Prizes are also awarded at the end of the Session.

A fee of 40 guineas admits to the whole of the Lectures for qualification (except Practical Physiology), and a further fee of 40 guineas to the Hospital Practice of the Royal Infirmary.

Prospectuses may be obtained from the Registrar at the College or at the School.

J HENRI NICHOLSON, Registrar

UNIVERSITY OF DURHAM COLLEGE

OF PHYSICAL SCIENCE, AT NEWCASTLE UPON TYNE

The Session will commence on the 6th October, 1873, and will be divided into the Michaelmas, Epiphany, and Easter Terms.

CLASSES

	Fee
Mathematics . . . W Steadman Aldis, M A	5 gs the session
Physics . . . A S Herchel, B A F R A S	5 gs "
Chemistry . . . A Frege-Marreco, M A	5 gs "
Geology . . . David Page, LL D F G S	5 gs "
Greek and Latin . . . Rev J Bulmer, B D	5 gs a term
English History and English Literature . . . Rev J Atkinson, B A	5 gs "
French, German, and Mechanical Drawing, each	10s 6d. "

In addition to the Class Fees, Students will be required to pay an Entrance Fee of One Guinea. Students who do not enter more than two Classes may commute the entrance fee for seven shillings for each Class. Students desirous of studying the whole of the first four subjects may compound for the class fees by payment of £17 17s. This will be the only composition fee allowed.

Students entering after the Michaelmas Term will be subjected to a Matriculation Examination. This will not be obligatory upon those entering at the commencement of the session.

All Students must have attained the age of 15 years.

Evening Classes will be held as in former sessions.

Further particulars respecting the Examinations, Association of the College, Laboratory Regulations, Scholarships, Exhibitions, House of Attendance, &c, will be found in the Prospectus of the College, to be had free on application to Mr THOMAS WOOD BURNING, Secretary to the College.

TWO COURSES OF LECTURES

ON GEOLOGICAL MINERALOGY -

WILL BE GIVEN AT KING'S COLLEGE, LONDON,

BY PROF TENNANT

To which the public are admitted on paying the College fees. One course is given on Wednesday and Friday mornings, from 9 to 10 o'clock, commencing Wednesday, Oct 8th, and terminating at Easter, 1874. The other course is given on Thursday evenings from 8 to 9, commencing Oct 9th. The lectures are illustrated by a very extensive collection of specimens. Practical Instructions in Mineralogy and Geology is given by Prof TENNANT, F G S, at his residence, 740, Strand, W C.

The WINTER SESSION will begin on Wednesday, October 1st. The clinical Practice of the Hospital comprises a service of 710 beds, inclusive of 24 beds for convalescents at Highgate.

Students can reside within the Hospital walls, subject to the College regulations.

For all particulars concerning either the Hospital or College, application may be made, personally or by letter, to the Resident Warden of the College. A handbook will be forwarded on application.

St. BARTHOLOMEW'S HOSPITAL and COLLEGE

SCHOLARSHIPS IN SCIENCE

Two Scholarships in Science have been founded at St Bartholomew's Hospital.

1. An open Scholarship of the value of £100, tenable for one year, to be competed for in September. The subjects of examination are Physics, Chemistry, Botany, and Zoology. The successful candidate will be required to enter at St Bartholomew's Hospital in October next.

2. Preliminary Scientific Scholarships of the value of £50, tenable for one year, to be completed in October next by the students of the Hospital of less than six months' standing. The subjects of examination are identical with those of the Open Scholarship.

For further particulars and syllabus of subjects, application may be made personally or by letter to the Warden of the College, St Bartholomew's Hospital.

MIDDLESEX HOSPITAL ENTRANCE

SCHOLARSHIPS—Two Entrance Scholarships, of the annual value of £25 and £50 respectively, each tenable for two years, are awarded at the commencement of the Winter session. There are numerous other Scholarships and Prizes. For the College Prospectus, containing information as to Fees, ENTRANCE and other Scholarships, Clinical Appointments, Residence, of Students, &c, apply to

JOHN MURRAY, M D, Dean

MEDICAL EDUCATION

ST. MARY'S HOSPITAL MEDICAL

SCHOOL will open on WEDNESDAY, October 1st, 1873, with an Introductory Address by Dr SHERRIN, at 8 1/2.

The Prospectus, containing full information with regard to the Special System of Instruction, and the Scholarships, Prizes, and Appointments, may be obtained on application to Mr Knott, the Registrar, at the Hospital, or to

W B CHEADLE, M D, Dean of the School

KING'S COLLEGE, LONDON.

ELECTRICITY AND MAGNETISM.

Professor W G ADAMS, F R S, will begin a Course of Lectures on Electricity and Magnetism on Thursday, the 9th of October, at 2 p m.

Practical instruction in the subjects of Heat, Light, Electricity, Magnetism, and their applications, is given in the Physical Laboratory. A Course of Lectures on Electricity and Magnetism will also be given on Wednesday evenings at 7 p m.

For further particulars apply to

J W CUNNINGHAM.

FOR PRICE-LISTS OF MICRO-PHOTO-

GRAPHIC APPARATUS, Micro-Materials, Microscopic Objects Mounted and Unmounted, address Micro, care of Mr Latham, Chemist, Romford, Essex.

RAY SOCIETY.

The volume issued for the year 1873—A Monograph of the Collembola and Thysanura, by Sir JOHN LUBBOCK, Bart, M P F R S, &c. 8vo with 276 Pages, and 25 Plates (11 coloured) is now ready.

The Annual Subscription is One Guinea.

Further information with reference to Membership and the back Volumes of the Society can be obtained on application to the Secretary, the Rev THOMAS WITTEMER, M A F L S, Granville Park, Lewisham, London S E.

THE INTERNATIONAL SCIENTIFIC SERIES.

A Series of Popular Treatises, embodying the results of the latest investigations in the various departments of Science at present most prominently before the world. Although these Works are not specially designed for the instruction of beginners, still, as they are intended to address the non-scientific public, they will be, as far as possible, explanatory in character, and free from technicalities. The object of each Author will be to bring his subject as near as he can to the general reader.

Crown 8vo, well printed on good paper, strongly bound, cloth extra, price not exceeding FIVE SHILLINGS each Volume.

I.
THE FORMS OF WATER IN RAIN AND RIVERS, ICE AND GLACIERS.

By J. TYNDALL, LL.D., F.R.S. With 36 Illustrations. Crown 8vo, cloth extra, 5s. [Third Edition ready.]

"Eloquent and instructive in an eminent degree."—*Brit. Quar. Review*
"One of Professor Tyndall's best scientific treatises"—*Standard*.

II.
PHYSICS AND POLITICS;

Or, Thoughts on the Application of the Principles of "Natural Selection" and "Inheritance" to Political Society. By WALTER BAGEHOT, Author of "The English Constitution," &c. Crown 8vo, cloth extra, 4s. [Second Edition ready.]

"Well deserving to be read by thoughtful students of politics."—*Saturday Review*.
"Able and ingenious."—*Spectator*.

III.
FOODS.

By EDWARD SMITH, M.D., LL.B., F.R.S. With numerous Plates and Illustrations. Crown 8vo, cloth extra, 5s. [Second Edition ready.]

"A comprehensive résumé of our present chemical and physiological knowledge of the various foods, solid and liquid."—*Chemist and Druggist*.
"A very valuable work." Dr. Smith has arranged his views of highly interesting facts in several divisions, and those who are desirous of studying this subject, whether from a chemical, social, or economical point of view, will find the volume of great service."—*Public Opinion*.

Messrs. **CHURCHILL'S WORKS****ON CHEMISTRY, BOTANY, THE MICROSCOPE, PHYSICS,
AND OTHER BRANCHES OF SCIENCE.**

CHEMISTRY, INORGANIC AND ORGANIC: with Experiments. By Charles L. BLOXAM, Professor of Chemistry in King's College, London; Professor of Chemistry in the Department for Artillery Studies, Woolwich. Second Edition With 295 Engravings on Wood 8vo, 16s.

By the same Author,

LABORATORY TEACHING; or, Progressive Exercises in Practical Chemistry, with Analytical Tables Second Edition. With 89 Engravings Crown 8vo, 5s 6d

PRACTICAL CHEMISTRY, including Analysis. By John E. Bowman and C. L. BLOXAM Sixth Edition. With 98 Engravings on Wood. Fcap 8vo, 6s 6d

NOTES FOR STUDENTS in CHEMISTRY: being a Syllabus of Chemistry and Practical Chemistry By ALBERT J. BERNAYS, Professor of Chemistry at St Thomas's Hospital. Fifth Edition, Revised. Fcap 8vo, 3s 6d.

A MANUAL OF ELEMENTARY CHEMISTRY, Theoretical and Practical. By G. FOWNES, F.R.S Edited by HENRY WATTS, B.A, F.R.S Eleventh Edition With Wood Engravings. Crown 8vo, 15s.

QUALITATIVE ANALYSIS. By C. Remigius Fresenius. Edited by Arthur Vacher. Eighth Edition, with Coloured Plate of Spectra and Wood Engravings 8vo, 12s. 6d

By the same Author,

QUANTITATIVE ANALYSIS. Edited by Arthur Vacher. Sixth Edition. With Wood Engravings 8vo, 13s. *In November.*

THE FIRST STEP IN CHEMISTRY A New Method for Teaching the Elements of the Science. By ROBERT GALLOWAY, Professor of Applied Chemistry in the Royal College of Science for Ireland. Fourth Edition, with Engravings Fcap 8vo, 6s 6d

By the same Author,

THE SECOND STEP IN CHEMISTRY; or, the Student's Guide to the Higher Branches of the Science. With Engravings Fcap 8vo, 10s.

Also,

A MANUAL of QUALITATIVE ANALYSIS. Fifth Edition, with Engravings. Post 8vo, 8s. 6d

FIRST PRINCIPLES of MODERN CHEMISTRY. By U. J. Kay-Shuttleworth, M.P. Second Edition. Crown 8vo, 4s 6d

HANDBOOK of VOLUMETRIC ANALYSIS; or, the Quantitative Estimation of Chemical Substances by Measure applied to Liquids, Solids, and Gases. Adapted to the requirements of pure Chemical Research, Pathological Chemistry, Pharmacy, Metallurgy, Manufacturing Chemistry, Photography, &c., and for the Valuation of Substances used in Agriculture, Commerce, and the Arts. By FRANCIS SUTTON, F.C.S., Norwich. Second Edition. With Engravings. 8vo, 12s

INTRODUCTION to INORGANIC CHEMISTRY. By Wm. G. Valentin, F.C.S., Principal Demonstrator of Practical Chemistry in the Royal School of Mines and Science, Training Schools, South Kensington. With 82 Engravings. 8vo, 6s 6d.

Also,

QUALITATIVE CHEMICAL ANALYSIS. With 19 Engravings. 8vo, 7s. 6d.

Also,

TABLES FOR THE QUALITATIVE ANALYSIS of SIMPLE and COMPOUND SUBSTANCES, both in the Dry and Wet Way. On indestructible paper. 8vo, 2s. 6d.

HANDBOOK of CHEMICAL TECHNOLOGY. Containing Chemical Metallurgy, Alloys, and Preparations made and obtained from Metals Crude Materials and Products of Chemical Industry, Glass, Ceramic Ware, Gypsum, Lime, Mortar. Vegetable Fibres. Animal Substances. Dyeing and Calico Printing. Artificial Light. Fuel and Heating Apparatus. By RÜDOLF WAGNER, Professor at the University of Wurtzburg. Translated from the Eighth Edition, with Additions, by WILLIAM CROOKES, F.R.S With 336 Engravings. 8vo, 25s.

COOLEY'S CYCLOPEDIA of PRACTICAL RECEIPTS, PROCESSES, and Collateral Information in the Arts, Manufactures, Professions, and Trades. including Pharmacy and Domestic Economy and Hygiene. Designed as a Comprehensive Supplement to the Pharmacopoeias and General Book of Reference for the Manufacturer, Tradesman, Amateur, and Heads of Families. Fifth Edition, Revised and partly Rewritten by Professor RICHARD V. TUSON, F.C.S., assisted by several Scientific Contributors. 8vo, 28s.

J. & A. CHURCHILL, NEW BURLINGTON STREET.

[Continued on next page.]

Messrs. CHURCHILL'S WORKS

ON CHEMISTRY, BOTANY, THE MICROSCOPE, PHYSICS,

AND OTHER BRANCHES OF SCIENCE.—*Continued*

A MANUAL of BOTANY: including the Structure, Functions, Classifications, Properties, and Uses of Plants By ROBERT BENTLEY, F.L.S., Professor of Botany, King's College, and to the Pharmaceutical Society Third Edition, with 1,127 Wood Engravings Crown 8vo [In the Autumn.

THE MICROSCOPE and its REVELATIONS. By W. B. Carpenter, M.D., F.R.S. Fifth Edition, with more than 500 Wood Engravings. Crown 8vo [In October.

A MANUAL of MICROSCOPIC MOUNTING; with Notes on the Collection and Examination of Objects By JOHN H. MARTIN, Author of "Microscopic Objects." With upwards of 100 Engravings. 8vo, 7s. 6d.

THE QUARTERLY JOURNAL of MICROSCOPICAL SCIENCE. (Established in 1852.) Edited by J. F. PAYNE, Demonstrator of Morbid Anatomy, and Assistant-Physician at St. Thomas's Hospital; E. RAY LANKRESTER, Fellow of Exeter College, Oxford, and W. T. THISELTON DYER, Professor of Botany to the Royal Horticultural Society. (Annual Subscription, 16s., Single Numbers, 4s.)

HANDBOOK for the PHYSIOLOGICAL LABORATORY. By E. Klein, M.D., Assistant-Professor in the Pathological Laboratory of the Brown Institution, London, J. BURDON SANDERSON, M.D., F.R.S., Professor of Practical Physiology in Trinity College, London, MICHAEL FOSTER, M.A., M.D., F.R.S., Professor of Physiology in Trinity College, Cambridge, and J. LAUDER BRUNTON, M.D., D.Sc., Lecturer on Materia Medica at St. Bartholomew's Hospital. Edited by J. BURDON-SANDERSON. Two Volumes, with 123 Plates, 8vo, 34s.

THE THANATOPHIDIA of INDIA; being a Description of the Venomous Snakes of the Indian Peninsula. With an Account of the Influence of their Poison on Life, and a Series of Experiments. By J. FAYRER, M.D., C.S.I., Honorary Physician to the Queen, late President of the Asiatic Society of Bengal. Second Edition, with 31 Plates (28 Coloured). Folio, 7l. 7s. [In November.

CHAUVEAU'S COMPARATIVE ANATOMY of the DOMESTICATED ANIMALS. Translated from the Second French Edition, and Edited by GEORGE FLEMING, F.R.G.S., Veterinary Surgeon, Royal Engineers. With 450 Engravings on Wood. 8vo, 1l. 11s. 6d.

A MANUAL of the ANATOMY of VERTEBRATED ANIMALS. By Prof. Huxley, LL.D., F.R.S. With numerous Engravings. Fcap 8vo, 12s.

By the same Author,

INTRODUCTION to the CLASSIFICATION of ANIMALS. With Engravings. 8vo, 6s.

NOTES on COMPARATIVE ANATOMY a Syllabus of a Course of Lectures delivered at St. Thomas's Hospital. By WILLIAM MILLER ORD, M.B. Lond, M.R.C.P., Assistant-Physician to the Hospital, and Lecturer in its Medical School. Crown 8vo, 5s.

THE STUDENT'S GUIDE to ZOOLOGY. By Andrew Wilson, Author of "Elements of Zoology," and Lecturer on Zoology, Edinburgh. With Engravings. [In November.

TABLES of ZOOLOGY; indicating the Tribes, Sub-Orders, Orders, and Higher Groups of the Animal Kingdom, for Students, Lecturers, and others. By J. REAY GREENE, M.D., Professor of Natural History in the Queen's University in Ireland. Three large sheets, 7s. 6d. the set, or, mounted on canvas, with roller, 18s.

NOTES on NATURAL PHILOSOPHY. By G. F. Rodwell, F.R.A.S., Lecturer on Natural Philosophy in Guy's Hospital, Science Master in Marlborough College. With 45 Wood Engravings. Fcap 8vo, 5s.

THE ELEMENTS of NATURAL PHILOSOPHY. By Charles Brooke, M.B., M.A., F.R.S. Based on the Work of the late Dr GOLDING BIRD. Sixth Edition, with 700 Engravings on Wood. Fcap. 8vo, 12s. 6d.

AN INTRODUCTION to PHYSICAL MEASUREMENTS; with Appendices on Absolute Electrical Measurement, &c. By Dr. F. KOHLRAUSCH. Translated from the Second German Edition by T. H. WALLER, B.A., B.Sc., and H. S. PROCTER, F.C.S. With Engravings. 8vo, 12s.

HARDWICH'S MANUAL of PHOTOGRAPHY. By George Dawson, M.A., Ph.D., Lecturer on Photography in King's College, London. Eighth Edition, with Engravings. Fcap 8vo, 5s. 6d.

A MANUAL of PHOTOGRAPHIC MANIPULATION. By Lake Price. Second Edition, Revised and Enlarged, with numerous Engravings. Crown 8vo, 6s. 6d.

J. & A. CHURCHILL, NEW BURLINGTON STREET.

ROYAL POLYTECHNIC INSTITUTION,

309, REGENT STREET, W.

LABORATORY and CLASS ROOMS are now open to ANALYSE Pupils and Class and Private Studies. Investigations connected with Patents Conducted. Classes are now forming in Chemistry, Physics, and Steam.—For Fees and Syllabus apply to the Professor of Chemistry, Scientific Department, Royal Polytechnic Institution.

ROYAL COUNCIL OF EDUCATION.

The Laboratory and Class-rooms of Barnes College are open for Pupils EVERY DAY and EVENING. The subjects of the above Examinations can be studied either Privately or in Classes. Fees moderate. Analyses and investigations conducted.—Apply to Prof. E. V. GARDNER, F.R.S., F.S.A., 44, Barnes Street, W.

SCHOOL OF CHEMISTRY,

80, GREAT MARLBOROUGH STREET, LONDON, W.

DIRECTED BY ARTHUR VACHER, F.C.S.

The Instruction is essentially practical, there are no Lectures. Each Student works independently.

The Course of Study is arranged to qualify the Student as an Analyst and to enable him generally to apply the science to any branch of industry but the Students are free to pursue their own particular object.

The hours are from Ten to Four. On Saturdays the Laboratory is reserved for Ladies.

The Charge is Five Pounds per Month. This includes instruction, Chemicals, Apparatus, &c. Occasional Students are received at the same rate, namely, Ten Shillings per Month for each Half-day in the Week. Schoolmasters requiring personal instruction pay Half-fees.

Second Edition, revised, imperial 8vo, price 12s

MY GARDEN:

ITS PLAN AND CULTURE.

Together with a General Description of its Geology, Botany, and Natural History.

By ALFRED SMEE, F.R.S.

Illustrated with more than 1,500 Engravings on Wood.

"Mr. Smees 'My Garden' is, indeed, a book which ought to be in the hands of every one who is fortunate enough to possess a garden of his own, he is certain to find some things in it from which he may profit."—*Nature*

"As for the illustrations, they are simply perfect. Lovers of gardens and lovers of art will join in prizing this book, in gratitude to Mr. Smees, and to those who have so ably and faithfully seconded his aim."—*Graephic*

"What Gilbert White did, in the last century, for his parish at Selborne, Mr. Smees has in the splendid volume before us done for his garden at Wallington in the present."—*The Gardener's Chronicle and Agricultural Gazette*

"Mr. Alfred Smees has produced the most original, most attractive and entertaining, most complete and unique Work on Gardening that has been offered to the public for the space of at least a quarter of a century."—*The Gardener's Magazine*

"Not only is there a vast store of information in this volume, but the tone throughout is wholesome and good."—*Athenaeum*

Fcap 8vo, flexible binding, price 4s 6d

THE BOTANIST'S POCKET BOOK,

Containing, in a tabular form, the Chief Characteristics of the British Plants, with the Botanical Name, Common Name, Soil or Situation, Colour, Growth, and Time of Flowering of every Plant, arranged under its own order.

By W. P. HAYWARD

"A little work supplying a great want, and calculated even to supersede Dr. Lindley's old well-known 'Synopsis of British Plants,' the only other work of the kind we know, and we can give it no higher praise. A small book but of great value, meant, not to supersede the bulkier manuals of the day, but intended for the sub-pocket of the plant-collector, and a companion which will surely be the more valued the more it is used."—*Yorkshire Naturalist's Recorder*

"A book of modest pretensions, and not without its value. As a rule there is no class of scientific literature to be more carefully avoided than that which professes to compress the whole of the elements of a science into a small portable volume. This little book, however, evidences great care in its preparation."—*Nature*

London. GEORGE BELL & SONS, York Street, Covent Garden.

Seventh Thousand, demy 8vo, with 800 Illustrations, 10s 6d.

THE HEAVENS: An Illustrated Hand-

book of Popular Astronomy

By AMEDEE GUILLEMIN.

Edited by J. NORMAN LOCKYER, F.R.S.

RICHARD BENTLEY and SON, New Burlington Street

Second Edition in royal 8vo, with 138 Illustrations, price 9s 5d

TRAVELS IN THE AIR.—A Popular

Account of Balloon Voyages and Ventures, with recent attempts to accomplish the Navigation of the Air. By J. GLAISHER, of the Royal Observatory, Greenwich.

RICHARD BENTLEY and SON, New Burlington Street.

In crown 8vo, with 251 Illustrations, 6s.

THE SUN. By Amedee Guillemin.

Author of "The Heavens." Translated by Dr. FRISON

RICHARD BENTLEY and SON, New Burlington Street

In crown 8vo, with several illustrations, 7s 6d.

THE DAY AFTER DEATH, or, the

Future Life as revealed by the Researches of Science. By LOUIS FIGUERA, author of "The World before the Deluge," &c.

RICHARD BENTLEY and SON, New Burlington Street

New Edition, in Crown 8vo with Illustrations, price 6s.

SERMONS IN STONES; or, Scripture

confirmed by Geology. By DOMINICK McCUSAUND, Q.C., LL.D.

*. This Edition, which has been carefully revised, and which will also contain a brief Memoir of the late Dr. McCausland, will be ready immediately.

RICHARD BENTLEY and SON, New Burlington Street

Will be ready 15th October. Extra fcap 8vo, cloth, price 2s 6d.

COLLINS'S ADVANCED SCIENCE SERIES

ANIMAL PHYSIOLOGY: the Structure

and Functions of the Human Body. By JOHN CLELAND, M.D. F.R.S., Professor of Anatomy and Physiology in Queen's College, Galway. With 150 Engravings.

London and Glasgow. WILLIAM COLLINS, SONS, & COMPANY.

SUITED TO THE NEWLY-REVISED SYLLABUS.

FIRST PRINCIPLES OF HUMAN PHY-

SIOLGY, and a few Applications of them, with Suggestions for Practical Work. For 1st Stage Science and Art Department's Examination, and for General use. By W. F. FULTON, Certificated Science Teacher. Carefully revised by accredited authorities. Illustrated. Second Edition, with Examination Questions, price 1s. post free.

London. JOHN KEMPSTER & CO., 9, 10, St. Bride's Avenue, Fleet Street, E.C., and all Booksellers.

PROOF COPIES

OF

THE PORTRAIT OF FARADAY,

May be had on India Paper, price 5s.

WORKS ON SCIENCE.

Now ready, Eighth Thousand, with Illustrations, crown 8vo, 12s

- 1.—**THE EXPRESSION OF THE EMOTIONS IN MAN AND ANIMALS** By CHARLES DARWIN, F.R.S.

- 2.—**A NATURALIST'S VOYAGE ROUND THE WORLD**, being a Journal of Research into the Natural History and Geology of Countries Visited By CH. DARWIN, F.R.S. Eleventh Thousand Post 8vo, 9s

- 3.—**THE ORIGIN OF SPECIES, BY MEANS OF NATURAL SELECTION**, or, The Preservation of Favoured Races in the Struggle for Life By CH. DARWIN, F.R.S. Sixth Edition With Glossary of Terms Post 8vo, 7s 6d

- 4.—**THE VARIOUS CONTRIVANCES BY WHICH ORCHIDS ARE FERTILISED BY INSECTS**, and on the Good Effects of Intercrossing By CH. DARWIN With Woodcuts Post 8vo, 9s

- 5.—**THE VARIATION OF ANIMALS AND PLANTS UNDER DOMESTICATION** By CH. DARWIN Third Thousand. With Illustrations 2 vols 8vo, 35s

- 6.—**THE DESCENT OF MAN, AND ON SELECTION IN RELATION TO SEX** By CH. DARWIN Eighth Thousand With Illustrations 2 vols 8vo, 34s

RECENT WORKS ON GEOLOGY.

Eleventh Edition, with numerous Illustrations, 2 vols. 8vo, 16s each

- 1.—**THE PRINCIPLES OF GEOLOGY**; or, the Modern Changes of the Earth and its Inhabitants, considered as Illustrative of Geology By Sir CHARLES LYELL, Bart., F.R.S.

- 2.—**THE GEOLOGICAL EVIDENCES OF THE ANTIQUITY OF MAN** With an Outline of Glacial Post-tertiary Geology, and remarks on the Origin of Species, with special reference to man's first appearance on the Earth By Sir CHARLES LYELL, F.R.S. Fourth Edition, revised, with Illustrations 8vo, 14s

- 3.—**THE STUDENT'S ELEMENTS OF GEOLOGY** By Sir CHARLES LYELL Sixth Thousand With 600 Illustrations Post 8vo, 9s

- SILURIA: A History of the Oldest Rocks** in the British Isles and other Countries, with Sketches of the Origin and Distribution of Native Gold, the General Succession of Geological Formations and Changes of the Earth's Surface By Sir Roderick I. MURCHISON Fifth Edition With Map, Plates, and Woodcuts. 2 vols. 8vo, 18s

- RECORDS OF THE ROCKS**; or, Notes on the Geology, Natural History, and Antiquities of North and South Wales, Devon, and Cornwall By Rev W. S. SYMONDS, F.G.S. With Illustrations Crown 8vo, 12s

- 1.—**PHYSICAL GEOGRAPHY**. By Mrs. SOMERVILLE Sixth Edition Revised by H. W. BATES, F.G.S. With Portrait. Post 8vo, 9s

- 2.—**SOMERVILLE ON THE CONNECTION OF THE PHYSICAL SCIENCES**. Ninth Edition With Portrait Post 8vo, 9s

- 3.—**SOMERVILLE ON MOLECULAR and MICROSCOPIC SCIENCE**. With Illustrations 2 vols Post 8vo, 18s.

- THE METALLURGY OF LEAD**, including the DESULPHURISATION and CUPELLATION By JOHN PERCY, F.R.S. With numerous Illustrations 8vo, 30s

JOHN MURRAY, Albemarle Street.

DRAPER'S INK (DICHROIC).

THE NEW BLACK INK

DIFFERING FROM ANYTHING ELSE EVER PRODUCED

Writing becomes a pleasure when this Ink is used. It has been adopted by the Principal Banks, Public Offices, and Railway Companies throughout Ireland.

It writes almost instantly Full Black. It flows easily from the Pen. Does not corrode Steel Pens. Blotting-paper may be applied at the moment of writing. Is cleanly to use, and our liable to Blot.

TO BE HAD OF ALL STATIONERS

BEWLEY AND DRAPER, DUBLIN.

FRY'S "A most delicious and valuable article."

CARACAS

Standard

COCO

"It is the very finest Cocoa ever offered to the public."—Court Circular

"As a delicious, refreshing, and nourishing beverage, with delicate flavour and fine aroma, it certainly surpasses anything that has yet been offered to the public."—London Mirror

PURE AERATED WATERS.

ELLIS'S

RUTHIN WATERS.

Soda, Potash, Seitzer, Lemonade, Lithia, and for GOUT, Lithia and Potash

CORKS BRANDED "R. ELLIS & SON, RUTHIN," and every Label bears their Trade Mark. Sold everywhere, and Wholesale of R. ELLIS & SON, Ruthin, North Wales. London Agents—W. HART & SONS, Henrietta Street, Cavendish Square

HOLLOWAY'S OINTMENT and PILLS.

--All persons afflicted with bad legs, sores, ulcers and skin diseases, who from want of means or other reasons cannot aid themselves of surgical treatment may relieve themselves of their complaints by using Holloway's purifying, soothing, and healing remedies. In every untoward complaint this wonderful Ointment brings about the most beneficial results by checking inflammation. Internal pains, rheumatic and gouty tortures, scrofulous swellings, and contracted sinews, may be overcome by diligently rubbing this cooling ingredient into the skin. Dysentery, too often the forerunner of Dysentery or cholera, should, without delay be stopped by frequent brisk friction of this ointment upon the abdomen, round while a flannel bandage should be worn until the attack entirely subsides.

RUPTURES.—BY ROYAL LETTERS PATENT

WHITE'S MOC-MAIN LEVER TRUSS

It is allowed by upwards of 500 Medical Men to be the most effective investment in the curative treatment of Hernia. The use of a steel spring, so often hurtful in its effects, is here avoided, a soft bandage being worn round the body, while the requisite restraining power is supplied by the MOC-MAIN PAD and PATENT LEVER, sitting with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fail to fit) forwarded by post, on the circumference of the body, 1 inches below the hips, being sent to the manufacturer,

JOHN WHITE, 228, Piccadilly.

Price of a single Truss, 20s., 25s., 30s., 35s., and 40s.

Doubles 30s., 35s., 40s., and 45s.

Unfinished 40s. and 50s. 6d.

Post-free

ELASTIC STOCKINGS, KNEE-CAPS,
Ac. for Varicose Veins and all cases of Weakness, and Swelling of the legs, Sprains, &c. They are porous, light in texture, and inexpensive, and draw on over an ordinary stocking. Price 4s. 6d., 7s. 6d., 10s., and 12s. each. Postage free.

JOHN WHITE, Manufacturer, 228, Piccadilly, London.

Atlas of 64 plates, containing several hundred
beautifully coloured figures of the most rare
half calf, net, 18s 10s For U.S. Exploring
Expedition Philadelphia, 1846 49

Only 200 copies printed for presents. The chief
difficulty in making up complete sets of the valuable
scientific Appendices to the United States Explor-
ing Expedition consists in obtaining this rare work
by hand.

This copy contains a MS. list of Errata, by the
Author, with his autograph

D'Archiac, le Vicomte, et
Jules Haime, Description des Animaux Fossiles
du groupe nummulitique de l'Alsace, precedee
du resume Geologique, 2 vols, imperial 4to
With 36 plates 12s 6d Paris, 1853-4

Darwin, C., on the Distribu-
tion of the Erratic Boulders and on the Con-
temporaneous Unstratified Deposits of South
America. With map, 4to 3s 1841

phia, small 4to, calf 1s Amsterdam, 1644
(To be continued.)

Just published, Second Edition, 8vo, cloth, 343 pp., 7s 6d

RESEARCHES IN ZOOLOGY, Illustrative of the Structure, Habits, and Economy of Animals By JOHN BLACKWALL, F.L.S.

"As a contribution to our zoological literature of an independent kind, Blackwall's pages stand alone—a type of the like of which we would, in this age of improved biological speculation, gladly see more of."—*Annals and Magazine of Natural History*, September 1873

JOHN VAN VOORST, 1, Paternoster Row.

Post 8vo, cloth, 231 pp., 6s

BIRDS OF THE HUMBER DISTRICT.

By JOHN CORDEAUX

"Its author exhibits a happy instance of the speculative and observing faculties which we have so greatly commended. He does not only enter in his note-book ornithological memoranda, but he endeavours to generalise from a long course of annual observations."—*Fraser's Magazine*, September, 1873

Second Edition, with Twenty Illustrations, price 7s 6d,

THE STORY OF THE EARTH & MAN.

By J. W. DAWSON, LL.D. F.R.S. & G.

Principal and Vice-Chancellor of McGill University Montreal, Author of "Archæia," "Acadian Geology," &c

"A book of rare excellence. An account of the geological history and the past life of the earth, full yet concise, accurate yet pictorial, and almost poetic."—*British Quarterly Review*

"The pleasantly written volume before us tells the story of the paleontology and physical geology of the earth in pre-human ages, and closes with a discussion of the theories of the appearance, late in geological time, of man upon the earth."—*Literary Review*

"Its most valuable volume. We commend the book to all who, either for themselves or for the sake of others, wish to obtain information on scientific subjects, presented in a reverential spirit, and with singular harmony and intelligence."—*Christian Observer*

Crown 8vo, 9s, cloth

THE HIGHER MINISTRY OF NATURE

Viewed in the Light of Modern Science By JOHN R. LEITCH, A.M., Author of "Our Coal Fields and our Coal Pits," "Corwall's Mines and Minerals," &c

"A rich contribution to the mental necessities of our time. It is the work of a mind comprehensive in its grasp, deep in its sympathy with nature, and strong in its love of truth. The author is known to science as a writer on geological subjects whose contributions deserve the highest respect."—*London Quarterly Review*

"Those who delight in speculations on the border-land between the natural and the supernatural, will find much to interest them in the volume, and to such we commend it."—*Nature*

"Mr Leitch glances with great clearness and vigour at the startling and vague theories of Darwin, and many of his most successful critics; he discusses minutely and with ready skill such topics as mental and moral evolution, materialism, life, protoplasm, as handled by Dr Haeckel and Prof. Huxley, and then naturally passes on to the subject of death, the immortality of the soul, men's ideas and conceptions of God and the world of spirits."—*Standard*

London: HODDER & STOUGHTON, 27 and 31, Paternoster Row.

MACMILLAN AND CO'S ANNOUNCEMENTS

CONTRIBUTIONS to SOLAR PHYSICS. By J NORMAN LOCKYER, F.R.S.
With numerous Illustrations. Royal 8vo, uniform with Roscoe's "Spectrum Analysis," Thomson's "Depths of the Sea," and Ball's "Mechanics."

On the **THEORY of SOUND.** By Lord RAYLEIGH. 8vo.

CAVE-HUNTING: Researches on the Evidence of Caves respecting the Early Inhabitants of Europe. By W. BOYD DAWKINS, F.R.S. Illustrated. Royal 8vo.

THE ORIGIN and METAMORPHOSES of INSECTS. By Sir JOHN LUBBOCK, F.R.S. With numerous Illustrations. Crown 8vo. (Vol. II. of NATURE Series.)

GLAUCUS; or, the Wonders of the Shore. By the Rev. CHARLES KINGSLEY. With numerous Coloured Illustrations. New and Revised Edition. Crown 8vo.

FIRST PRINCIPLES of MODERN SCIENCE; or, a First Course of Lectures delivered in the University of Cambridge. By the Rev. T. R. BIRKES, Professor of Moral Philosophy. Crown 8vo, 8s. 6d.

HIGHER SCHOOLS and UNIVERSITIES of GERMANY. By MATTHEW ARNOLD, D.C.L. Crown 8vo.

COMPARATIVE POLITICS. By EDWARD A. FREEMAN, D.C.L. Lectures at the Royal Institution. 8vo.

HISTORY of the ENGLISH PEOPLE, for the Use of Colleges and Higher Classes in Schools. By the Rev. J. R. GREEN, M.A. Crown 8vo.

OLEOGRAPHS AND ENGRAVINGS.

A SELECTION OF THE MOST BEAUTIFUL LANDSCAPES AND FIGURE SUBJECTS IN HANDSOME GOLD FRAMES, FROM ONE GUINEA EACH.

Anyone just furnishing should pay a visit to

GEO. REES,
41, 42, 43, RUSSELL STREET, OPPOSITE DRURY
LANE THEATRE.

THE ONLY CHEAP FARMERS' NEWSPAPER.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE,

Edited by JOHN ALGERNON CLARKE, Secretary to the Central Chamber of Agriculture.

Devotes special attention to the discussions and proceedings of the Chambers of Agriculture of Great Britain (which now number upwards of 15,000 members), besides giving original papers on practical farming, and a mass of intelligence of particular value to the agriculturist. The London Corn, Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to insure delivery to country subscribers by the first post on Tuesday morning. Price 3d, or prepaid, 15s a year post free.

Published by W. PICKERING, 47, Abchurch Lane, Strand, W.C.

THE BREWERS' GUARDIAN:

A fortnightly paper devoted to the Protection of Brewers' Interests, Licensing,

Legal, and Parliamentary matters.
REVIEW OF THE MALT AND HOP TRADES; AND WINE AND SPIRIT TRADES RECORD.

The Official Organ of the County Brewers' Society.

(Founded 1858.)

"The Brewers' Guardian" is published on the Evenings of every alternate Tuesday, and is the only journal officially connected with brewing interests. Subscription, 15s 6d per annum, post free, dating from any quarter-day. Single Copies, 6s. each. Registered for Transmission Abroad.

Office—2, Bond Court, Walbrook, London, E.C.

THE

JOURNAL OF APPLIED CHEMISTRY.

A MONTHLY PUBLICATION OF 16 PAGES QUARTO.

Devoted to Chemistry as applied to Arts and Manufactures, Agriculture, Metallurgy, &c. &c.

At Two Dollars and Twenty-five Cents per annum, or One Dollar and Seventy-five Cents paid strictly in advance, including postage to United Kingdom.

Each number contains Original Articles on General Chemistry applied to Arts and Manufactures, Matter on Particular Fabrications, as Petroleum, Soaps, Tanning, Dyeing, and numerous others. A suitable space is also devoted to Practical Recipes and interesting Scientific Facts.

Full and carefully-prepared Market Reviews and Prices Current of Drugs and Chemicals of every description are given in each number for New York, Boston, and Philadelphia, with Tables of Imports.

EIGHTH VOLUME, commenced with January number.

DEXTER & CO, PUBLISHERS.

"THE GARDEN."

A Weekly Illustrated Journal Devoted Solely to Horticulture in all its branches.

THE GARDEN is conducted by WILLIAM ROBINSON, F.L.S., Author of "Hardy Flowers," "Alpine Flowers for English Gardens," "The Parks, Promenades, and Gardens of Paris," &c.; and the best Writers in every department of Gardening are contributors to its pages.

The following are some of the subjects regularly treated in its pages:—

The Flower Garden.
Landscape Gardening.
The Fruit Garden.
Garden Structures.
Room and Window Gardens.
Notes and Questions.
Market Gardening.
Trees and Shrubs.

Hardy Flowers.
Town Gardens.
The Conservatory.
Public Gardens.
The Greenhouse and Stove.
The Household.
The Wild Garden.
The Kitchen Garden.

THE GARDEN may be obtained through all Newsagents and at the Railway Bookstalls, at 4d. per copy. It may also be had direct from the Office at 2s. for a Quarter, 5s. 6d. for a Half-year, and 10s. 6d. for a Year, payable in advance, and in Monthly Parts. Specimen Copies (post-free), 4d.

Edited by ROBERT CHAMBERS, LL.D.

THE BOOK OF DAYS.

A WORK CONSISTING OF

1. MATTERS CONNECTED WITH THE CHURCH KALENDAR.
Including the Popular Festivals, Saints' Days, and other Holidays With Illustrations of Christian Antiquities in general.
2. PHENOMENA CONNECTED WITH THE SEASONAL CHANGES.
3. FOLK-LORE OF THE UNITED KINGDOM.
Namely, Popular Notions and Observances connected with Times and Seasons.
4. NOTABLE EVENTS, BIOGRAPHIES, AND ANECDOTES
Connected with the Days of the Year.
5. ARTICLES OF POPULAR ARCHÆOLOGY,
of an Entertaining Character, tending to illustrate the Progress of Civilisation, Manners, Literature, and Ideas in these Kingdoms.
6. CURIOUS FUGITIVE AND INEDITED PIECES.
7. CURIOSITIES of LITERATURE, and ODDITIES of HUMAN LIFE and CHARACTER.

It has been the desire of the Editor, by this work—while not discouraging the progressive spirit of the age—to temper it with affectionate feeling towards what is poetical and elevated, honest and of good report in the old national life; while in no way discountenancing great material interests, to evoke an equal activity in those feelings beyond self, on which depend remoter but infinitely greater interests, to kindle and sustain a spirit of patriotism, tending to unity, peace and prosperity in our own estate, while not exclusive of feelings of benevolence, as well as justice, towards others. It has been, further, the desire of the Editor that these volumes should be a repertory of old fireside ideas in general, as well as a means of improving the fireside wisdom of the present day.

W & R. CHAMBERS, LONDON & EDINBURGH.

THE SCIENTIFIC SOCIETIES CLUB.

J. LOGAN LOBLEY, ESQ.,

59, CLARENDON ROAD, KENSINGTON PARK, W.

Or, during the Meeting of the British Association, Reception Room, Bradford.

THE MINERAL WATERS OF VALS.

The Waters of Vals owe to their low temperature and to their richness in carbonic acid, the possession of a capacity which permits them to be transported to the longest distances without undergoing the least alteration.

The springs *Saint-Jean, Fécussé, Dhaire, Figuelette, Magdeleine*, by their alkalinity, fluidify the liquids of the abdominal organs, and communicate to them a reparative impulse. They increase and facilitate the urinary secretion and cutaneous perspiration. They disaggregate the molecules which constitute, by their union, gravel or calculus of the kidneys or of the liver, and prevent nephritic or hepatic colics; they ward off gouty attacks and lessen notably their violence; they prevent green sickness by restoring regular movements to the organs; they awake vital motion; neutralise the acidities and dispel the heaviness of stomach, prepare for easy digestion, and give, in short, to the whole economy a comfort that one would vainly seek elsewhere.

DEPOT.—E. GALLAIS & Co., 27, Margaret Street, Regent Street, London. W.

A 'WEEKLY ILLUSTRATED JOURNAL OF SCIENCE.

"To the solid ground

Of Nature trusts the mind which builds for aye."—WORDSWORTH

UNIVERSITY of DURHAM COLLEGE OF PHYSICAL SCIENCE, AT NEWCASTLE-UPON-TYNE

The Session will commence on the 6th October, 1873, and will be divided into the Michaelmas, Epiphany, and Easter Terms

CURSES

		For
Mathematics	W Steadman Aldis, M.A.	5s 6d the session
Physics	A & Herschel, B.A. F.R.S.	5s 6d "
Chemistry	A. Freire-Marreco, M.A.	5s 6d "
Geology	David Peck, LL.D. F.G.S.	5s 6d "
Greek and Latin	Rev J Bulmer, B.D.	2s 6d a term
English History and English Literature	Rev J Atkinson, B.A.	2s 6d "
French, German, and Mechanical Drawing, &c.		10s 6d "

In addition to the Class Fees, Students will be required to pay a Entrance Fee of One Guinea. Students who do not enter more than two Classes may commute this on payment of Seven shillings for each Class.

Students desirous of studying the whole of the first four subjects may compound for the class fees by payment of £12 12s. This will be the only composition fee allowed.

Students entering after the Michaelmas Term will be subjected to a Matriculation Examination. This will not be obligatory upon those entering at the commencement of the session.

All Students must have attained the age of 15 years.

Evening Classes will be held as in former sessions.

Further particulars respecting the Examinations, Associateship of the College, Laboratory Regulations, Scholarships, Exhibitions, Hours of Attendance, &c., will be found in the Prospectus of the College, to be had free on application to Mr. THOMAS BUNNING, Secretary to the College.

EDINBURGH VETERINARY COLLEGE, under the Patronage of the Highland and Agricultural Society, the Lord Provost, Magistrates, and Council of the City of Edinburgh, Trustees of the late Professor Dick

Founded in 1823

The Fifty-first Session will be opened on Wednesday the 29th October, by an address delivered in the Theatre of the College, at Two o'clock, by Professor FRANKLEY (Principal).

Medicine, Surgery, and Clinical Anatomy	Professor FRANKLEY (Principal)
Physiology	MURPHY, M.D. F.R.S. F.G.S.
Chemistry	YOUNG, M.D.
Botany	DEWAR, F.R.S. F.R.S.
Comparative Pathology	HALFOUR, M.D. F.R.S.
	WALLEY, M.R.C.V.S.

The Matriculation Examination for Students entering for the first time will be conducted by the Rector of the Royal High School, at times to be named on application to the Secretary.

For Fees and other information apply to the Secretary, Wm. DUMBERCHIE, Esq., M.D. F.R.C.S., 49, Albany Street, Edinburgh.

SCIENCE TUITION BY CORRESPONDENCE.—Mr. RUTLEDGE, B.Sc. F.C.S., Bowdon, Cheshire.

NOTICE.—ROYAL SCHOOL OF MINES, Jermyn Street, London.—The 2nd Session will begin on Wednesday, the 1st October. Prospectuses may be had on application.

TRENHAM REEKS, Registrar

MIDDLESEX HOSPITAL COLLEGE

provides the most complete means for a Medical Education. Some Members of the Staff receive Students as Boarders.

MIDDLESEX HOSPITAL ENTRANCE

SCHOLARSHIPS.—Two Entrance Scholarships, of the annual value of £25 and £50 respectively, each tenable for two years, are awarded at the commencement of the Winter Session. There are numerous other Scholarships and Prizes. For the College Prospectus, containing information as to Fees, ENTRANCE and other Scholarships, Clinical Appointments, Residence of Students, &c., apply to

JOHN MURRAY, M.D., Dean

KING'S COLLEGE, LONDON.

ELECTRICITY AND MAGNETISM

Professor W.G. ADAMS, F.R.S., will begin a Course of Lectures on Electricity and Magnetism on Thursday, the 4th of October, at 2 p.m.

Practical instruction in the subjects of Heat, Light, Electricity, Magnetism, and their applications, is given in the Physical Laboratory.

A Course of Lectures on Electricity and Magnetism will also be given or Wednesday evenings at 7 p.m.

For further particulars apply to

J. W. CUNNINGHAM.

KING'S COLLEGE.

GEOLOGY—EVENING CLASSES

A Course of Thirty Lectures on Geology and Palaeontology will be given by the Rev. THOMAS WILKINSON, M.A. F.G.S., on Monday Evenings, commencing October 6th. There will be also two or more Field Lectures in the neighbourhood of London on Saturday Afternoons in the Lent Term, and an Excursion of two or three days' duration, at a distance from London, in the Easter Term.

For additional information apply to the Secretary, King's College, Strand, London.

KING'S COLLEGE.

EVENING LECTURES

CHEMISTRY.—Mr. W. N. HARTLEY

Monday and Thursday at 7 o'clock. Fee for the Course, £1 12s 6d

CHEMICAL ANALYSIS.—Mr. W. N. HARTLEY

Tuesday, from 7 till 9 o'clock. Fee, £2 2s

FIRST PRINCIPLES of MORAL SCIENCE; or, a First Course of Lectures delivered in the University of Cambridge By the Rev. T. R. BIRKS, Professor of Moral Philosophy Crown 8vo, 8s 6d

HIGHER SCHOOLS and UNIVERSITIES of GERMANY. By MATTHEW ARNOLD, D.C.L. Crown 8vo.

COMPARATIVE POLITICS By EDWARD A. FREEMAN, D.C.L. Lectures at the Royal Institution. 8vo

HISTORY of the ENGLISH PEOPLE, for the Use of Colleges and Higher Classes in Schools. By the Rev. J. R. GREEN, M.A. Crown 8vo

New Volume of Macmillan's Scientific Class-Books

STEAM. By J. Perry, Assistant Master at Clifton College.

The PRINCIPLES of SCIENCE. By W. Stanley Jevons, Professor of Logic in Owens College, Manchester.

THE PHYSIOLOGY of the CIRCULATION in PLANTS, in the LOWER ANIMALS. and in MAN By J. BELL PETTIGREW, M.D., F.R.S., with 150 Engravings on Wood Second Edition, 8vo.

A HISTORY of the MATHEMATICAL THEORIES of ATTRACTION and the Figures of the Earth from the time of Newton to that of Laplace. By I. TODHUNTER, M.A., F.R.S. 2 vols. 8vo.

The THEORY of EVOLUTION of LIVING THINGS, and the APPLICATION of the Principles of Evolution to Religion, considered as illustrative of the Wisdom and Beneficence of the Almighty. By the Rev. G. HENSLOW, M.A., F.R.S.

SIMPLE PRACTICAL METHODS of CALCULATING STRAINS on GIRDERS, ARCHES, and TRUSSES, with a Supplementary Essay on Economy in Suspension Bridges By E. W. YOUNG, Associate of King's College, London, and Member of the Institute of Civil Engineers. 8vo.

A MANUAL of the CHEMISTRY of the CARBON COMPOUNDS, or, Organic Chemistry By C. SCHORLEMMER, F.R.S. 8vo.

New Volumes of "Nature" Series.

The ORIGIN and METAMORPHOSES of INSECTS. By Sir JOHN LUBBOCK, F.R.S. With numerous Illustrations Crown 8vo.

The BIRTH of CHEMISTRY. By G. F. Rodwell, F.R.S. With numerous Illustrations. Crown 8vo.

THE ELEMENTS of EMBRYOLOGY. By Michael Foster, M.A. F.R.S., Praelector in Physiology at Trinity College, Cambridge; and F. M. BALFOUR, Scholar of Trinity College, Cambridge.

MACMILLAN & CO., LONDON.

RAY SOCIETY.

The volume issued for the year 1871—A Monograph of the Collemola and Thysanura, by Sir JOHN LUBBOCK, Bart., M.P., F.R.S., &c. 8vo, with 276 Pages, and 78 Plates (31 coloured) is now ready.

The Annual Subscription is One Guinea.

Further information with reference to Membership and the back Volumes of the Society can be obtained on application to the Secretary, the Rev THOMAS WILKINSON, M.A., F.L.S., Granville Park, Lewisham, London, S.E.

ROYAL POLYTECHNIC INSTITUTION, 309, REGENT STREET, W.

LABORATORY and CLASS ROOMS are now open for ANALYSES Pupils and Class and Private Studies. Investigations connected with Patents Conducted. Classes are now forming in Chemistry, Physics, and Steam.—For Fees and Syllabus apply to the Professor of Chemistry, Scientific Department, Royal Polytechnic Institution.

ROYAL COUNCIL OF EDUCATION.—

The Laboratory and Class-rooms of BERNERS College are open for Pupils EVERY DAY and EVENING. The subjects of the above Examinations can be studied either Privately or in Classes. Fees moderate. Analyses and investigations conducted.—Apply to Prof R. V. GARDNER, F.R.S., F.S.A., 46, Berners Street, W.

SCHOOL OF CHEMISTRY,

20, GREAT MARLBOROUGH STREET,
LONDON, W.

DIRECTED BY ARTHUR VACHER, F.C.S.

The Instruction is essentially practical; there are no Lectures. Each Student works independently.

The Course of Study is arranged to qualify the Student as an Analyst and to enable him generally to apply the science to any branch of industry. But the students are free to pursue their own particular object.

The hours are from ten to four. On Saturdays the Laboratory is reserved for Ladies.

The Charge is Five Pounds per Month. This includes Instruction, Chemicals, Apparatus, &c. Occasional Students are received at the same rate, namely, The Shillings per Month for each Half-day in the Week. Schoolmasters requiring personal instruction pay Half-fees.

WANTED, a first-class Manufacturing Chemist, capable of taking full charge of the manufacture of Artificial Manures. References as to ability and character must be unexceptional. A liberal remuneration will be given. Apply to F. B., Post Office, Liverpool.

EVENING SCIENCE LECTURES.—

Mr. W. J. WILSON, F.C.S., will commence a Course of 12 Lectures on Electricity, Magnetism, Light, Heat, and Sound, at the Brickbeck Institution, Southampton Buildings, Chancery Lane, on Monday, October 6th, at 8 o'clock, to be continued on succeeding Mondays at the same hour. Fee for the course, 2s. 6d. For Syllabus of Examinations, Prices, &c. apply to the Librarian.

Mr. Wilson will also lecture on Thursdays at the new Quebec Institute, Lower Seymour Street, Portman Square. For particulars apply to Secretary.

At the Class Examinations of the Science and Art Department, May 1871, 68 papers in Physics were worked by Mr. Wilson's pupils. Of these, 45 passed First Class and obtained Queen's Prizes; 23 passed Second Class, and none failed.

HOW TO WORK WITH THE MICROSCOPE.

By Dr. LOREN EPPAR, F.R.S.

A Manual of Microscopical Manipulation. Examining Objects under
the highest Powers, Photographing specimens, &c.

HARRISON, Pall Mall

OWENS COLLEGE, MANCHESTER.

The SESSION 1873-4 will be OPENED in the New Buildings, Oxford-road, on Tuesday, the 7th October, at twelve o'clock at noon, by his Grace the DUKE OF DEVONSHIRE, K.G., President of the College.

In consequence of the limited accommodation which can be afforded for this meeting only invited guests and students holding tickets can be admitted. The Council invite all persons attending this meeting to wear Academic Costume.

Tickets, not transferable, may be obtained by bond-fide students (other of the day, evening, or medical classes) (or persons proposing to become such in the ensuing session) on application to the Registrar until the number allotted for students is exhausted.

The Principal will attend at the College on Wednesday, the 1st October, and following days except Saturday, at 10 a.m. for the purpose of furnishing students for the Day Classes and Medical School.

Candidates for admission must not be under 14 years of age, and those under 16 will be required to pass a preliminary examination in English, arithmetic, and the elements of Latin. Prospective students will be sent on application, and further details relating to each department as well as to scholarships and entrance examinations, will be found in the Circular which may be obtained from Mr. Cornish, Librarian, Pocklington to the College, and at the College. Price 4s. 6d., by post 5s. 10d.

OWENS COLLEGE.

EVENING CLASSES

The EVENING SESSION will commence on Monday, the 12th October. New students (only) will be admitted on Wednesday, the 8th, and two following days, from 6.30 to 8 p.m. Former students may re-enter on Monday, the 12th, to Friday, the 17th October inclusive, from 6.30 to 8 p.m.

J. HOLME NICHOLSON, Registrar

THE ONLY CHEAP FARMERS' NEWSPAPER. THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE,

Edited by JOHN ALGERNON CLARK, Secretary to the Central Chamber of Agriculture.

Devotes special attention to the discoveries and proceedings of the Chambers of Agriculture of Great Britain (which now number upwards of 15,000 members), besides giving original papers on practical farming, and a mass of intelligence of particular value to the agriculturist.

The London Corn, Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to insure delivery to country subscribers by the first post on Tuesday morning. Price 3d., or prepaid, 15s. a year post free.

Published by W. PICKERING, 21, Abchurch Lane, Strand, W.C.

Second Edition

HOLIDAYS ON HIGH LANDS; or, Rambles and Incidents in Search of Alpine Plants. By the Rev HUGH MACMILLAN, LL.D., Author of "Bible Teachings in Nature," &c. Globe 8vo, 6s.

In this edition the author has completed the journal of his tour in Norway, which broke off abruptly and was left unfinished in the last. A large amount of additional information regarding the distribution of British and Norwegian plants, and the geological changes connected with them has also been incorporated, and several interesting and important facts borrowed from classic story, and from the records of zoology and geology, throwing light upon these changes have been given. Twenty-four pages of new matter have been added, and the whole work has been thoroughly revised, and is hoped greatly improved.

MACMILLAN & CO., London.

TWO COURSES OF LECTURES

ON GEOLOGICAL MINERALOGY

WILL BE GIVEN AT KING'S COLLEGE, LONDON,

BY PROF. TENNANT.

In which the public are admitted on paying the College fees. One course is given on Wednesday and Friday mornings, from 9 to 10 o'clock, commencing Wednesday, Oct. 8th, and terminating at Easter, 1874. The other courses are given on Thursday evenings from 8 to 9, commencing Oct. 9th. The lectures are illustrated by a very extensive collection of specimens.

Practical Instructions in Mineralogy and Geology is given by Prof. TENNANT F.G.S., at his residence, 149, Strand, W.C.

DR. HARTWIG'S POPULAR WORKS ON NATURAL HISTORY

Now ready, the Fourth and Cheaper English Copyright Edition, enlarged and improved, with a coloured Hydrographic Map of both Hemispheres of the Globe, upwards of Three Hundred Woodcuts in the Text, and a Series of Eight Chromo-zylographic Plates, in 8vo, cloth, price 10s. 6d.

THE SEA and its LIVING WONDERS; a Popular Account of the Marvels of the Deep, and of the Progress of Maritime Discovery from the Earliest Ages to the Present Time. By DR. GEORGE HARTWIG

Also, Latest Editions, uniformly illustrated:—

- Hartwig's "Polar World," price 21s.
- "Tropical World," price 21s. 6d.
- "Harmonies of Nature," price 18s.
- "Subterranean World," price 18s.

"THE GARDEN,"

A Weekly Illustrated Journal Devoted solely to Horticulture in all its
branches.

THE GARDEN is conducted by WILLIAM ROBINSON, F.L.S., Author of
"Hardy Flowers," "Alpine Flowers for English Gardens," "The Parks,
Promenades, and Gardens of Paris," &c., and the best Writers in every de-
partment of Gardening are contributors to its pages.

The following are some of the subjects regularly treated in its pages:—

The Flower Garden	Hardy Flowers
Landscape Gardening	Town Gardens
The Fruit Garden	The Conservatory
Garden Structures	Public Gardens
Room and Window Gardens	The Greenhouse and Stove
Notes and Questions	The Household
Market Gardening	The Wild Garden
Trees and Shrubs	The Kitchen Garden.

THE GARDEN may be obtained through all Newsagents and at the Railway
Bookstalls, at 6d per copy. It may also be had direct from the Office at 5s
for a Quarter, 9s 6d for a Half-year, and 17s 6d for a Year, payable in ad-
vance, and in Monthly Parts. Specimen Copies (post-free), 41d.

17, Southampton Street, Covent Garden, W.C.

HOLLOWAY'S OINTMENT and PILLS

—Negligence, always inexcusable, becomes altogether unpardonable
when a pestilence such as cholera threatens to walk through the land,
and relentlessly claim all ages for its victims. Have these remedies
hasty! Let this Ointment be instantly, briskly, and perseveringly rubbed
upon the abdomen when disordered. At certain seasons, when the air
is rife with infection and the water provokes disease, it becomes
the paramount duty of all travellers to keep themselves, and their families in
full health and vigour. No wound or sore should be permitted to run its
destructive course, when all such predisposing causes of danger may be
effectually removed by this healing Ointment and these purifying Pills,
without enervating or irritating the constitution.

THE SPECTROSCOPE AND ITS APPLI-

CATIONS. By J. NORMAN LOCKYER, F.R.S. With Coloured
Plates and numerous Woodcuts. Being Vol. I of "NATURE
SERIES," a Series of Popular Scientific Works now in course of Pub-
lication.

THE DEPTHS OF THE SEA. An Account

of the General Results of the Dredging Cruises of H.M.S. *Porcupine*
and *Lightning*, during the Summers of 1868, 1869, and 1870, under the
Scientific Direction of Dr Carpenter, F.R.S., J. Cowen Jeffreys, F.R.S.,
and Dr Wyville Thomson, F.R.S. By Dr WYVILLE THOMSON,
F.R.S., Director of the Scientific Staff of the *Challenger* Expedition.
In 8vo, cloth, extra gilt, with nearly 100 Illustrations and 8 Coloured
Maps and Plans, price 11s 6d.

"Nothing can be more complete than the account of the scientific results
of these voyages, which are fully illustrated by woodcuts of the strange forms
of life brought from the dark depths of the ocean, by charts of soundings,
and colour tables of deep-sea temperature."—*Daily News*

"Looking at the engraving, it is not too much to say that such illustrations
of the peculiarly delicate and complicated forms of lower animal life
have yet appeared."—*Times*

THE FORCES OF NATURE. A Popular

Introduction to the Study of Physical Phenomena. By ARTHUR
GUTHRIE MIN. Translated from the French by Mrs. NORMAN
LOCKYER, and Edited, with Addition and Notes, by J. NORMAN
LOCKYER, F.R.S. Illustrated by 12 Coloured Plates and 455 Woodcuts.
Second Edition. Royal 8vo, cloth, extra, 11s 6d.

"Translator and Editor have done justice to their trust. The text has
all the force and flow of original writing, combining faithfulness to the author's
meaning with purity and independence in regard to idiom, while the techni-
cal precision and accuracy pervade the work throughout, speak of the
author's editorial supervision, which has been every way every-
where. Altogether, the work may be said to have no parallel, either in point
of fulness or attraction, is a popular or manual of physical science."—*Saturday*

RUPTURES.—BY ROYAL LETTERS PATENT

WHITE'S MOC-MAIN LEVER TRUSS

is allowed by upwards of 300 Medical Men to be the most effective invention in the curative treatment of Hernia. The use of a steel spring, so often hurtful in its effects, is here avoided, a soft bandage being worn round the body, while the requisite retaining power is supplied by the MOC-MAIN PAD and PATENT LEVER, hung with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fail to fit) forwarded by post, on the circumference of the body, a inches below the hips, being sent to the manufacturer,

JOHN WHITE, esq, Piccadilly.

ROYAL SCHOOL OF MINES.

Professor FRANKLAND, D.C.L., F.R.S., will commence a course of Forty Lectures on INORGANIC CHEMISTRY at the New Buildings, Exhibition Road, South Kensington, on Monday next, the 6th October, at 10 o'clock, to be continued on each succeeding Wednesday, Friday, and Monday, at the same hour. Fee for the course, £4. Laboratory practice, £12 for three months.

Professor HUXLEY, LL.D., F.R.S., will commence a course of Eighty Lectures on BIOLOGY (or Natural History, including Paleontology), with laboratory instruction, at the New Buildings, Exhibition Road, South Kensington, on Monday, the 6th October, at 10 o'clock, to be continued on every week-day but Saturday. Fee for the Lectures, £4. for the Laboratory instruction, £6.

TRENHAM REEKS, Registrar

UNIVERSITY OF DURHAM COLLEGE OF PHYSICAL SCIENCE, AT NEWCASTLE-UPON-TYNE

The Session will commence on the 6th October, 1873, and will be divided into the Michaelmas, Epiphany, and Easter Terms.

CLASSES

		Fee
Mathematics	... W. Steadman Aldis, M.A.	... 5s. the session
Physics	... A. S. Herschel, B.A. F.R.S.	... 5s. "
Chemistry	... A. Frazer-Marreco, M.A.	... 5s. "
Geology	... David Page, LL.D. F.G.S.	... 5s. "
Greek and Latin	... Rev. J. Bulmer, B.D.	... 2s. a term.
English History and English Literature	... Rev. J. Atkinson, B.A.	... 2s. 2d.
French, German, and Mechanical Drawing, each 10s. 6d.

In addition to the Class Fees, Students will be required to pay an Entrance Fee of One Guinea. Students who do not enter more than two Classes may commute this on payment of Seven Shillings for each Class.

Students desirous of studying the whole of the first four subjects may compound for the class fees by payment of £17 17s. This will be the only composition fee allowed.

Students entering after the Michaelmas Term will be subjected to a Matriculation Examination. This will not be obligatory upon those entering at the commencement of the session.

All Students must have attained the age of 15 years.

Evening Classes will be held as in former sessions.

Further particulars respecting the Examinations, Association of the College, Laboratory Regulations, Scholarships, Exhibitions, Hours of Attendance, &c., will be found in the Prospectus of the College, to be had free on application to Mr. THOS. WOOD BURNING, Secretary to the College.

SCIENCE TUITION BY CORRESPONDENCE.—MR. ROUTLEDGE, B.Sc. F.C.S., Bowdon, Cheshire

TWO COURSES OF LECTURES

ON GEOLOGICAL MINERALOGY

WILL BE GIVEN AT KING'S COLLEGE, LONDON.

BY PROF. TENNANT

To which the public are admitted on paying the College fees. One course is given on Wednesday and Friday mornings, from 9 to 10 o'clock, commencing Wednesday, Oct. 8th, and terminating at Easter, 1874. The other courses are given on Thursday evenings from 8 to 9 o'clock, commencing Oct. 9th. The lectures are illustrated by a very extensive collection of specimens.

Practical Instructions in Mineralogy and Geology is given by Prof. TENNANT F.G.S., at his residence, 140, Strand, W.C.

KING'S COLLEGE.

EVENING LECTURES.

CHEMISTRY—MR. W. N. HARTLEY

Mondays and Thursdays at 7 o'clock. Fee for the Course, £12s. 6d.

CHEMICAL ANALYSIS—MR. W. N. HARTLEY

Tuesdays, from 7 till 9 o'clock. Fee, £4s.

KING'S COLLEGE

GEOLOGY—EVENING CLASSES

A Course of Thirty Lectures on Geology and Paleontology will be given by the Rev. THOMAS WILTSHIRE, M.A. F.G.S., on Monday Evenings, commencing October 6th. There will be also two or more Field Lectures in the neighbourhood of London on Saturday Afternoons in the Last Term, and an Excursion of two or three days' duration, at a distance from London, in the Easter Term.

For additional information apply to the Secretary, King's College, Strand, London.

ANIMAL PHYSIOLOGY.

KING'S COLLEGE.

EVENING CLASSES.

Dr. URBAN FRITCHARD will commence his Winter Course on Wednesday, October 6th at 7 p.m. The course is especially adapted to meet the requirements of Candidates for the Degrees of B.A. and B.Sc. in the University of London.

MACMILLAN & CO., CAMBRIDGE,

List of Second-hand Scientific Books (continued).

- Meteorological Papers** published by authority of the Board of Trade, 4 vols. 4to, 10s 1859-60
- Monge, G., Application de l'Analyse à la Géométrie, revue et corrigée par Lavoisier, 4to, half calf, very scarce, 35s** Paris, 1850
- Moseley, Canon, on the Cause of the Descent of Glaciers, 8vo, 1s**
- Murray, A., the Geographical Distribution of Mammals. With upwards of 100 plates and maps, and many woodcuts, 4to, cloth, (pub. 3/ 3s), 58s** 1866
- Naturalist's Library, edited by Sir William Jardine, with 1,000 coloured plates, 4 vols., fcap. 8vo, cloth, new, gilt tops (pub. 12/ 1s), 5/ 5s. Birds, 14 vols. Animals, 13 vols. Insects, 7 vols. Fishes, 6 vols.**
- New York, Report of Geological Survey, by Dr. Kay, I. C. Beck, T. A. Conrad, W. W. Mather, E. Emmons, L. Vanuxem, and James Hall, 2 vols. in 1, royal 8vo, half calf, 12s** Albany, 1838-9
- Observations Meteorologiques faites à Monte Dural, 1839, 45, and 1850-51, 54 parts, 8vo, sewed, 8s**
- Owen, D.D., Report of a Geological Survey of Wisconsin, Iowa, and Minnesota, and incidentally of a portion of Nebraska territory. With a large number of maps, plates, and woodcuts. Royal 4to, cloth, 25s** Philadelphia, 1852
- Owen, Prof., Papers read before the Geological Society, 4to, sewed, with numerous plates, 35s 6d**
- Palæontological Society's Publications, from the commencement in 1847 to 1849, 26 vols. in 27 large 4to vols. 40s 3s — 1847 to 1850, and 1850, 14 vols. in 15, 13/ 10s. Issued to subscribers only**
- Palæontographical Memoirs** Prof. E. Forbes on Fossil Invertebrata from Southern India. Prof. Owen on the Labyrinthodonts of Wattenberg and Warwickshire, and other Tracts by Owen, Harlan, Riley, and Clarke. In 2 vols. 4to, cloth, 31s 6d Philadelphia, 1852
- Peclet, E., Traite de la Chaleur considérée dans ses applications. Troisième édition. 3 vols. 8vo, half calf, 21s 6d** Paris, 1860
- Pierce, B., Physical and Celestial Mechanics. 4to, cloth, 27s** Boston, 1855
- Phillips, J., The Rivers, Mountains, and Sea coast of Yorkshire. With 32 plates, 8vo, cloth, 12s** 1853
- Phillips, W., Outline of the Geology of England and Wales, with maps, sections of strata, &c. 2mo, half calf, 3s 6d** 1818
- Pingre, Comptographie ou Traité Historique et Théorique des Comètes. 9 vols. 4to, cloth, 22s 6d** Paris, 1783
- Pontecoulant, Theorie Analytique du Systeme du Monde, 4 vols. 8vo, half rusia, 30s** Paris, 1829
- Prichard, J. C., The Natural History of Man, with 36 coloured and 4 plain illustrations engraved on steel, and 60 engravings on wood, royal 8vo, cloth. Also, 6 Philosophical Maps, with a sheet of letterpress, folio. The two works, 25s.**
- Quarterly Journal of Pure and Applied Mathematics. Edited by J. Sylvester and N. P. Farrow, assisted by Professors Stokes and Cayley, and M. Hermite. Vols. 1 to 5, half calf, vols. 6 to 9 in a vol. half cloth, together 9 vols. in 7, not uniform, 3/ 5s (pub. at 5s)** 1859-60
- Quetelet, A., Memoire sur les Variations Périodiques et non Périodiques de la Température, 8vo, 4to, with a plate, 3s**
- Sedgwick, Prof., Collection of Papers by 11, 4to, and 8 8vo, many of them very scarce. The lot, 30s**
A few copies of the following for sale, separately —
Addresses delivered at the Anniversary Meeting of the Geological Society, 1850 and 1851, 8vo, 1s 6d — On the New Red Sandstone in the Basin of the Eden, and North western Coasts of Cumberland and Lancashire. With coloured plate, 4to, 2s 6d — Four Letters to the Editors of the *Journal de Médecine*, in reply to R. M. Beverly, F.R.S. 8vo 12. Camb. 1856 — On a proposed separation of the so-called Caradoc System into two distinct groups, viz. (1) May Hill Sandstone, (2) Caradoc Sandstone. 8vo 12. 1859 — On the Lavas and Non-metamorphic of Lower Palæozoic Rocks of England and Wales. 8vo 11. — Remarks on a passage in the President's (H. Milnes) Address at the Anniversary Meeting of the Geological Society of London, Feb. 15, 1856, 1s
- Sedgwick and Murchison —** On the Deposits between the Primary Rocks and the Cretaceous Series in the North of Scotland — Darwin. On Volcanic Phenomena in South America. With other scarce Tracts by Sedgwick, Darwin, Lonsdale, and Winch. 1 vol. 4to, numerous plates, 42s
- Sedgwick and Murchison on the Distribution and Classification of the Old or Palæozoic Depositions of the North of Germany and Belgium, and on their correspondence with formations of the same age in the British Isles. 1849 — Viscount d'Archiac and M. de Vermeil on the Fossils of the Older Depositions in the Lithuanian Provinces, preceded by a general Survey of the Fauna of the Palæozoic Rocks, and followed by a tabular List of the Organic Remains of the Devonian System in Europe. A vol. with plates, geological map, &c., 15s**
- Selwin, Alfred R. C., Large map of Victoria (6ft by 4 ft.), geologically coloured, 15s** Melbourne, 1863
- Sharpe, D., on the Arrangement of the Foliation and Cleavage of the Rocks of the North of Scotland. With geological map and plate, 4to, 3s 6d** 1852
- Sheepshank, R., Correspondence with Habgale, R. & Co. 2 vols. 4to, Tracts, 8vo, Morocco, gilt top, with portrait, 12s**
Professor Sedgwick's copy
- Smith, C. Piazzi, Two Lectures on the present state of the longitude question in navigation. Square 2mo, 4s 6d** Edinburgh
- Smyth, W. H., The Cycle of Celestial Objects continued at the Hartwell Observatory in 1859. With numerous plates and illustrations, royal 4to, cloth (printed for private circulation), 50s** 1860
- Sowerby, James, The Mineral Conchology of Great Britain, or, Coloured Figures and Descriptions of those Remains of Testaceous Animals or Shells which have been preserved at various times &c. &c. in depths in the Earth. With Portraits of James Sowerby, engraved. 6 vols. royal 8vo, half Morocco, nice copy, £11 12s** 1822-30
- Steinhauer, On Fossil Reliquia of unknown Vegetables in the Cul Strata. — Macleure, W., Observations on the Geology of the United States. With geological map and 3 plates, 2 coloured, 7s 6d.** 1818
- Swainson, W., Introductory Observations on the Natural System — Lea, I., Observations on the Genus Uro. With 16 plates beautifully coloured. With 9 other Tracts by Smyth, J. D. Forbes, Henslow, Sir J. Richardson, &c. 1 vol. 4to, half calf, 30s**
- Thomson, W., On the Dynamical Theory of Heat. Part 6 Thermo-electric Currents, 4to, 3s 6d** 1854
- Tyndall, J., On the Vibration of Tones produced by the Contact of Bodies having different Temperatures. 4to, 1s 6d** 1854
- Tyson, Dr. E., The Anatomy of a Pigmy compared with that of a Monkey, an Ape and a Man, to which is added the Anatomy and Description of a Rattlesnake, also of the Musk Hog, and edition, 6d, calf, with plates, 15s** 1751
- Virchow, R., La Pathologie Cellulaire basée sur l'étude Physiologique et Pathologique des tissus. Traduction Française par Paul Picard. Troisième édition, avec 250 figures, 8vo, 5s 6d** Paris, 1860
- Westwood, J. O., and H. N. Humphreys, British Butterflies and their Transformations. With 42 plates, beautifully hand-coloured, 4to, original edition, half calf, very scarce, 52s 6d** 1841
- British Moths and their Transformations. With 124 plates, beautifully hand-coloured, 4 vols. 4to, half Morocco, gilt edges, very scarce, £7 4s** 1851
- Wheatstone, C., An Account of some Experiments to measure the velocity of Electricity and the direction of Electric Light. With 15 other Tracts by Henslow, Whewell, Murchison, &c. 4to, half calf, 22s 6d**
- Young, G., and Bird, J., A Geological Survey of the Yorkshire Coast, describing the Strata and Fossils occurring between the Hamble and the Tees, from the German Ocean to the Plain of York. Illustrated with numerous engravings, 4to, half calf, 35s.** Whitby, 1842

BOOKS WANTED TO PURCHASE.

- FARADAY'S ELECTRICITY. 3 vols. or vols 2 and 3
- SUPPLEMENT TO SOWERBY'S BOTANY 1st edition, 1 vol.
- WILLIS'S APPARATUS for the USE of LECTURERS
- FERRUSSAC and D'ORBIGNY. Hist. des Cephalopodes Acetabulifères. 1 vol. folio, or any odd parts to complete a copy
- SOWERBY'S GENERA OF SHELLS. Odd parts to complete a copy
- MEMOIRES de la SOCIÉTÉ GÉOLOGIQUE de FRANCE, and series, vol. 8, part 2 to —
- CAMBRIDGE MATHEMATICAL JOURNAL. 4 vols or Nos. 7 and 23 to 26
- CAMBRIDGE and DUBLIN MATHEMATICAL JOURNAL. 9 vols or any separate vols or numbers
- ASTRONOMICAL SOCIETY'S MONTHLY NOTICES. A Set.

With 6 Lithographic Plates, No LII—New Series, 4s

QUARTERLY JOURNAL OF MICROSCOPICAL SCIENCE.

MEMOIRS—

The Structure of the Eye of the Lobster By Edwin T. Newton, Assistant Naturalist, Her Majesty's Geological Survey

Methods of Investigating the Central Nervous System in Man By Professor W. J. H. Kiehl

New Contributions to the Theory of Fermentations By L. Pasteur

A Review of Recent Observations on Paratyphoid By W. Archer, M.R.I.A.

Contributions to the Anatomy of Ascaris: The Intestine of the Frog and Lead By Dr. E. Klein

A Further Contribution to the Natural History of Bacteria and the Germ Theory of Fermentative Changes By Joseph Lister, F.R.S., Professor of Clinical Surgery in the University of Edinburgh

On a Black-coloured Bacterium (Bacterium rubro-roseum) By F. Ray Lankester, M.A., Fellow and Lecturer of Exeter College, Oxford

REVIEWS—

Illustrated Guide to the Fish, Amphibian, Reptilian and Mammalian Remains of the Cretaceous and Tertiary Periods By W. H. Dall

Atlas of the Fishes By Thomas Fisher Barker, F.R.S.

NOTES AND MEMORANDA—

Carnine Staining
Chronic Acid and Spent for Hardening
The Movements of the Glands in Diuresis

QUARTERLY CHRONICLE OF MICROSCOPICAL SCIENCE—

Embryology

Dublin Microscopical Club
East Kent Natural History Society

* Vol. XIII, New Series, with 21 Plates, cloth, 12s

J. and A. CHURCHILL, New Burlington Street

THE JOURNAL OF APPLIED CHEMISTRY.

A MONTHLY PUBLICATION OF 16 PAGES QUARTO,

Devoted to Chemistry as applied to Arts and Manufactures, Agriculture, Metallurgy, &c. &c.

At Two Dollars and Twenty-five Cents per annum, or One Dollar and Seventy-five Cents paid singly in advance, including postage to United Kingdom.

Each number contains Original Articles on General Chemistry applied to Arts and Manufactures, Matter on Particular Fabrications, as Petroleum, Soda, Tanning, Dyeing, and numerous others.

A valuable space is also devoted to Practical Recipes and interesting Scientific Facts.

Full and carefully prepared Market Reviews and Prices Current of Drugs and Chemicals of every description are given in each number for New York, Boston, and Philadelphia, with Tables of Imports.

EIGHTH VOLUME, commenced with January number.

DEXTER & CO., PUBLISHERS,

Spruce Street, New York 48, Hanover Street, Boston, and 4th, South 4th Street, Philadelphia, Pa., U.S.A.

NEWMAN'S ENTOMOLOGIST.

A MONTHLY ILLUSTRATED JOURNAL OF BRITISH INSECTS

Conducted by EDWARD NEWMAN, F.L.S. & F.Z.S., &c.,

Late President of the Entomological Society

The objects of the *Entomologist* are to give every information about insects; more especially to work out the history of those which attack Fruit and Forest Trees, Vegetables, Root and Seed Crops, Greenhouse and Garden Plants, with a view to suggesting remedies. Notes, Observations, and Queries on every branch of the Science are solicited. To preserve a continuous record of the occurrence of insects. To improve collections by offering a ready medium for the exchange of specimens.

Published on the First of every Month.

PRICE SIXPENCE.

SIMPKIN, MARSHALL, and Co., Stationers' Hall Court

* Subscriptions for one year, post free, Six Shillings, payable in advance to Edward Newman, 9, Devonshire Street, Bishopsgate, E. Prepayment by the year effectually removes the possibility of irregular delivery by provincial booksellers.

THE ONLY CHEAP FARMERS' NEWSPAPER, THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE,

Edited by JOHN ALGERNON CLARKE, Secretary to the Central Chamber of Agriculture.

Devotes special attention to the discussions and proceedings of the Chambers of Agriculture of Great Britain (which now number upwards of 18,000 members), besides giving original papers on practical farming, and a mass of intelligence of particular value to the agriculturist.

The London Corn, Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to insure delivery to country subscribers by the first post on Tuesday morning. Price 3d., or prepaid, 15s. a year post free.

Published by W. PULKERING, 21, Arundel Street, Strand, W.C.

"THE GARDEN,"

A Weekly Illustrated Journal Devoted Solely to Horticulture in all its branches.

THE GARDEN is conducted by WILLIAM ROBINSON, F.L.S., Author of "Hardy Flowers," "Alpine Flowers for English Gardens," "The Pinks, Pinks, and Gardens of Paris," &c., and the best Writers in every department of Gardening are contributors to its pages.

The following are some of the subjects regularly treated of in its pages—

The Flower Garden	Hardy Flowers
Landscape Gardening	Town Gardens
The Fruit Garden	The Conservatory
Garden Structures	Public Gardens
Roses and Window Gardens	The Greenhouse and Stove
Notes and Questions	The Household
Market Gardening	The Wild Garden
Fest and Shows	The Kitchen Garden

THE GARDEN may be obtained through all Newsagents and at the Railway Bookstalls, at 4d. per copy. It may also be had direct from the Office at 5s. for a quarter, or 9s. 6d. for a half-year, and 17s. 6d. for a year, payable in advance, and in Monthly Parts. Specimen Copies (post-free), 4d.

17, Southampton Street, Covent Garden, W.C.

THE BREWERS' GUARDIAN:

A fortnightly paper devoted to the Protection of Brewers' Interests, Licensing, Legal, and Parliamentary matters.

REVIEW OF THE MALT AND HOP TRADES, AND WINE AND SPIRIT TRADES

The Official Organ of the Country Brewers' Society.

(Founded 1874)

"The Brewers' Guardian" is published on the Evenings of every alternate Tuesday, and is the only journal officially connected with brewing interests. Subscription, 18s. 6d. per annum, post free, dating from any quarter-day. Single Copies, 6s. each. Registered for Transmission Abroad.

Offices—5, Bond Court, Walbrook, London, E.C.

CHANGE OF PUBLISHERS

On the 1st of every Month, pp. 32, 8vo, with at least One Plate.

THE JOURNAL OF BOTANY,

BRITISH AND FOREIGN,

Edited by HENRY TRIMEN, M.B., F.L.S., British Museum, assisted by J. G. BAKER, F.L.S., Royal Herbarium, Kew.

Subscriptions for 1873 (18s. post free in the United Kingdom) payable in advance to the publishers, Messrs. Rankin and Co., Drury House, 51, Mark Lane, London, E.C., of whom may be obtained the volume for 1873 (price 16s. 6d. bound in cloth) also covers for the volume (price 12s.) and back numbers.

THE ZOOLOGIST.

A MONTHLY JOURNAL OF NATURAL HISTORY.

Conducted by EDWARD NEWMAN, F.L.S. & F.Z.S. &c.

The *Zoologist* was established in 1843 to record and preserve observations on subjects similar to those treated of in White's "Natural History of Selborne," and the success which has attended it is sufficient proof that its plan is acceptable to "out of door naturalists," those who delight in observing the manners, habits, the private lives, the migrations, movements, nests, young and food of animals.

It contains original papers and records of facts relating to Quadrupeds, Birds, Reptiles, Fishes, and Insects, together with notices of recent works on every branch of Natural History. The Editor has been assisted by more than two hundred of our very best zoologists.

Published on the First of every Month

PRICE ONE SHILLING.

RAY SOCIETY.

The volume issued for the year 1891—A Monograph of the Collembola and Thysanura, by Sir JOHN LUBBOCK, Bart, M.P. F.R.S., &c. 8vo, with 276 Pages, and 10 Plates (3 coloured) is now ready.

The Annual Subscription is One Guinea.

Further information with reference to Membership and the back Volumes of the Society can be obtained on application to the Secretary, the Rev THOMAS WILTSHIRE, M.A. F.L.S., Granville Park, Lewisham, London, S.E.

ROYAL COUNCIL OF EDUCATION.—

The Laboratory and Class rooms of BERNERS College are open for Pupils EVERY DAY and EVENING. The subjects of the above Examinations can be studied either Privately or in Classes. Fees moderate. Analyses and Investigations conducted.—Apply to Prof. E. V. GARDNER, F.R.S., F.S.A., 44, Berners Street, W.

ROYAL POLYTECHNIC INSTITUTION,

309, REGENT STREET, W.

LABORATORY and CLASS ROOMS are now open for ANALYSES. Pupils and Classes and Private Studies. Investigations connected with Patents Conducted. Classes are now forming in Chemistry, Physics, and Natural History.—For Fees and Syllabus apply to the Professor of Chemistry, 5, Cavendish Department, Royal Polytechnic Institution.

SCHOOL OF CHEMISTRY,

20, GREAT MARLBOROUGH STREET,
LONDON, W.

DIRECTED BY ARTHUR VACHER, F.C.S.

The instruction is essentially practical, there are no Lectures. Each Student works independently.

The Course of Study is arranged to qualify the Student as an Analyst and to enable him generally to apply the science to any branch of industry.

The Students are free to pursue their own particular objects.

The hours are from 10 to 4. On Saturdays the Laboratory is reserved for Ladies.

The Charge is Five Pounds per Month. This includes Instruction, Chemicals, Apparatus, &c. Occasional Students are received at the same rate, namely, Ten Shillings per Month for each Half day in the Week. Schoolmasters requiring personal instruction pay Half-fees.

LADIES' EDUCATIONAL ASSOCIATION.

In connection with University College, London.—Two Evening Courses of Lectures (adapted to teachers and candidates for examinations), will be given to Ladies at University College, respectively on the study of English, by Prof. Morley, on Mondays at 6, beginning Oct. 23; and on English History, by Prof. Bunsell, on Wednesdays at 5.30, beginning Oct. 19.

The Day Classes will open on Monday, October 27. Prospectuses to be had at the office in the College, or of J. E. Mylne, 27, Oxford Square, W.

FRENCH.—Conversation, Reading, Special

Lessons on Pronunciation.—Translation.—Correspondence, by Dr. CLAUDON, FARMAN, 443, Strand (opposite the Charing Cross Station). Dr. Claudon is M.A. of Paris and M.R.C.S. of England, and has had ten years' successful experience in teaching French in this city. List of references sent free.

RICHARDSON BROS. & Co., of Belfast,

Dublin, and Cork, Manufacturers of Artificial Manures, Oil-crushers, &c. require a Practical Chemist capable of taking charge of the manufacture of their manures, &c. at their works in Belfast. Apply, with references, and stating salary, to Richardson Bros. and Co., Belfast.

BRITISH EGGS AND BIRD-SKINS

MR. J. C. STEVENS begs to announce that he will sell by Auction, at his Great Rooms, 18, King Street, Covent Garden, on THURSDAY, Oct. 27, at half-past 10 precisely, the VALUABLE COLLECTION OF BIRDS' EGGS formed by Wm. Marshall, Esq., at Clayhill, Bedford, principally furnished from the sale of the late W. Verrell, Esq., and from the collections made by Messrs. Woolley, Newton, Wheelwright, &c., also about 25 Cases of Stuffed Birds.

On view from 10 to 12 o'clock, and catalogues had one week prior.

DR HARTWIG'S POPULAR WORKS ON NATURAL HISTORY

Now ready, the Fourth and Cheaper English Copyright Edition, enlarged and improved, with a coloured Hydrographic Map of both Hemispheres of the Globe, upwards of Three Hundred Woodcuts in the Text, and a Series of Eight Chromoxylographic Plates, in 8vo, cloth, price 10s. 6d.

THE SEA and its LIVING WONDERS;

a Popular Account of the Marvels of the Deep, and of the Progress of Maritime Discovery from the Earliest Ages to the Present Time. By Dr. GEORGE HARTWIG.

Also, Latest Editions, uniformly illustrated.—

Hartwig's "Polar World," price 11s.
 "Tropical World," price 10s. 6d.
 "Harmless Nature," price 12s.
 "Subterranean World," price 12s.

London LONGMANS, GREEN, & CO. Paternoster Row.

Will be ready 15th October. Extra fcap 8vo, cloth, 10s. 6d.

COLLINS' ADVANCED SCIENCE SERIES

ANIMAL PHYSIOLOGY: the Structure and Functions of the Human Body. By JOHN CLELAND, M.D. F.R.S., Professor of Anatomy and Physiology in Queen's College, Galway. With 150 Engravings.

London and Glasgow WILLIAM COLLINS, SONS, & COMPANY.

TEXT-BOOK BY DR. BEALE, F.R.S.

AN INTRODUCTION TO PHYSIOLOGY and MEDICINE. 2 Volumes. Pp. 350, with 42 Plates, 6s. 6d.

J. & A. CHURCHILL

New Work by DR. LIONEL BEALE, F.R.S.

DISEASE GERMS: and on the Treatment

of the Fevers of the East. 2 Volumes, 12s. 6d.
 I. Supposed Natives. II. Real Natives. III. Destruction.

J. & A. CHURCHILL

Eighth Thousand, with 70 Plates, 4 Coloured, cloth, 12s.

HOW TO WORK WITH THE MICROSCOPE. By Dr. LIONEL BEALE, F.R.S.

A Manual of Microscopical Manipulation. Examining Objects under the highest powers, Photomicrographs, &c. &c.

HARRISON, Pall Mall

PROFESSOR BAIN'S NEW WORK ON MIND AND BODY.

This day is published, crown 8vo, with 4 Illustrations, cloth, price 4s.

MIND AND BODY: the Theories of their

Relations. By ALEXANDER BAIN, LL.D., Professor of Logic at the University of Aberdeen.

*A New Volume of "The International Scientific Series"

HENRY S. KING & CO., 65, Cornhill, and 18, Paternoster Row.

Now ready, royal 8vo, pp. 54, cloth, 7s. 6d.

CENTRIFUGAL FORCE and GRAVITATION. A Lecture. By JOHN HARRIS, of Montreal, Canada.

Also, royal 8vo, pp. 24, cloth, 5s.

SUPPLEMENT (A) to the above. With Illustrations.

TRUBNER & CO., 57 and 59, Ludgate Hill, London, E.C.

BROWNING'S NEW ROTATING BODY MICROSCOPE.

COMBINING THE ADVANTAGES OF THE ENGLISH AND CONTINENTAL MODES.

The Model Microscope, with highly finished Brass Band, £ s. d.
Rack and fine Adjustments to body, with Axis for inclination, one Eye-piece, Concave Mirror, and 1-inch Objective,
and $\frac{1}{4}$ -inch object glasses 5 5 0

The "Complete" Microscope. This Instrument has a highly finished brass Stand, Rack, and fine adjustment to body, and Mechanical motions to stage, and is supplied with an Eye-piece, and two high-class Objectives, 1-inch and $\frac{1}{4}$ inch of which the performance will be guaranteed 7 10 0

The above Instrument, Binocular 10 10 0

Stephenson's New Binocular.

List of Microscopes free.

ESTABLISHED 100 YEARS.

An Illustrated Descriptive Catalogue of Spectroscopes, 18 Stamps.

VICHY WATERS COMPANY,
27, MARGARET STREET, REGENT STREET, LONDON, W.
DEPOT FOR ALL FOREIGN MINERAL WATERS, VICHY.

The use of the Natural Waters of Vichy is extending vastly. They are most efficacious in all complaints arising from acidity. They make the blood more alkaline and less coagulable, and promote its circulation. In the derangement of the digestive functions, and in all the chronic disorders of the abdominal organs, their good effects are shown. The Waters of Vichy are alkaline and gaseous, and although medicinal they are agreeable to the palate, from their slightly acid taste. Of all mineral waters they are the most exported.

HOLLOWAY'S OINTMENT AND PILLS

combine both sanative and curative powers in a high degree;—by the former term is understood their ability to preserve health, by the latter their capability to restore health. With these remedies at hand, no invalid need be at fault without venustous restrictions of habits, comforts or enjoyments, to guide himself or herself through the many trials to which everyone is subjected, whose occupation demands attention in all weathers, and leaves little opportunity for self nursing. Coughs, colds, ulcerated throats, dyspepsia and whooping cough, can be successfully treated by well rubbing this ointment upon the chest, and by taking the pills. The same treatment is equally effective in digestive derangements, labour disorders, and bowel complaints.

NEW AND IMPORTANT WORK ON SCIENCE AND RELIGION.

THE BIBLE AND THE DOCTRINE OF EVOLUTION.

By WM WOODS SMYTH.

"This work accepts, almost without qualification, the Doctrine of Evolution as interpreted by Mr. Herbert Spencer and Mr. Charles Darwin, and connects it with the Bible as but the physical or natural side of its own doctrine, which it illustrates, extends, confirms. This is accomplished, not by accommodating each to the other, but by accepting both in their simplest and most manifest sense: the evidence of which is that the plain and obvious interpretation of Scripture is the one most congruous with the Principles of Evolution."—*Preface*

LESSONS IN ELEMENTARY ANA-

TOMY. By ST. GEORGE MIVART, F.R.S. &c., Lecturer on Comparative Anatomy at St. Mary's Hospital, Author of “The Genesis of Species.”

These Lessons are intended for teachers and students of both sexes not already acquainted with anatomy. The author has endeavored, by certain additions and by the mode of treatment, also to fit them for students in medicine, and generally for those acquainted with human anatomy, but desirous of learning its more significant relations to the structure of other animals.

“It may be questioned whether any other work on anatomy contains in like compass so proportionately great a mass of information.”—*Lancet*

“The work is excellent, and should be in the hands of every student of human anatomy.”—*Medical Times*

MACMILLAN & CO., LONDON

HOLLOWAY'S OINTMENT AND PILLS.

—Tumours, Scrofulous and Glandular Swellings.—While the temperature is variable—the days hot, and mornings and evenings very chilly—such diseases are constantly presenting themselves in sanguine and feeble frames. All sufferers have placed within their reach the antidote to these dreadful scourges, which at their commencement may be readily checked and cured, but, if neglected, evolve, for a long time the most appropriate remedy. Holloway's Ointment, rubbed on the affected parts, will thoroughly eradicate the cause of these maladies, and expel their seed from the system. Scurvy, scrofula, and all kindred disorders disappear before this cleansing Ointment and these purifying Pills, which cleanse and invigorate.

[All Rights are Reserved.]

QUEEN'S COLLEGES, IRELAND.—The

Professorship of Materia Medica in the Queen's College, Galway, being now vacant. Candidates for that Office are requested to forward their Testimonials to the Under Secretary, Dublin Castle, on or before MONDAY the 27th instant, in order that the same may be submitted to their Excellencies the Lords Justices.

The Candidate who may be selected for the above Professorship will have to enter upon his duties at once.

Dublin Castle, 9th October, 1873

LADIES' EDUCATIONAL ASSOCIATION, in connection with University College, London

The Day Classes for Ladies, at University College, will open Monday October 27.

The subjects for this Season are English Literature, French Literature, Composition, and Grammar, Italian and German Languages and Literatures, Logic, Physiology and Hygiene, French History, English Constitutional History, Mathematics (ratio and proportion), Practical Physics and Arithmetic.

Prospectuses to be had in the office at the College, or of J. E. Mylne Esq., 17, Oxford Square, Hyde Park, W.

KING'S COLLEGE.

EVENING LECTURES

CHEMISTRY—Mr W. N. HARTLEY

Mondays and Thursdays at 7 o'clock. Fee for the Course, £1 12s 6d.

CHEMICAL ANALYSIS—Mr W. N. HARTLEY

Tuesdays, from 7 till 9 o'clock. Fee, £1 12s.

SCHOLASTIC or Otherwise—A Situation

will be required after Christmas by an Analytical Chemist, on F.C.S., well accustomed to Tuition. At present Assistant Chemical Master in a Public School. Highest testimonials, prize medal, &c.—Address—A.F.S., Mr Billington, Rugby.

GEOLOGY.—Collections of Characteristic

Fossils and Rocks for Students preparing for the Examinations, at moderate prices: also single specimens. Handbooks, Pocket lessons, Books, and all necessities of JAMES R. GREGORY, Geologist, 25, Russell Street, Covent Garden, W. C.

ROYAL COUNCIL OF EDUCATION.—

The Laboratory and Class rooms of BERNERS College are open for Pupils EVERY DAY and EVENING. The subjects of the above Examinations can be studied either Privately or in Classes. Fees moderate. Analyses and investigations conducted.—Apply to Prof. E. V. GARDNER F.E.S., F.S.A. 44 Berners Street W.

ROYAL POLYTECHNIC INSTITUTION,

309, REGENT STREET, W.

LABORATORY and CLASS ROOMS are now open for ANALYSES. Pupils and Class and Private Studies. Investigations connected with Patents conducted. Classes are now forming in Chemistry, Physics, and vice versa.—For Fees and Syllabus apply to the Professor of Chemistry, Scientific Department, Royal Polytechnic Institution.

SCHOOL OF CHEMISTRY,

20, GREAT MARLBOROUGH STREET,
LONDON, W.

DIRECTED BY ARTHUR VACHER, F.C.S.

The Instruction is essentially practical: there are no Lectures. Each Student works independently.

The Course of Study is arranged to qualify the Student as an Analyst and to enable him generally to apply the science to any branch of industry. But the Students are free to pursue their own particular object.

The hours are from 10 to 4 on Saturdays the Laboratory is reserved for Ladies.

The Charge is Five Pounds per Month. This includes Instruction, Chemicals, Apparatus &c. Occasional Students are received at the same rate, namely, Ten Shillings per Month for each Half day in the Week. Schoolmasters requiring personal instruction pay Half fees.

SCIENCE TUITION BY CORRESPONDENCE—Mr ROUTLEDGE, B.Sc. F.C.S., Bowdon, Cheshire

BRITISH EGGS AND BIRD-SKINS

Second Edition, crown 8vo, 3s.

THE CHILDHOOD OF THE WORLD: a Simple Account of Man in Early Times

By EDWARD CLODD F.R.S.

"This genial little volume is a child's book as to shortness, cheapness, and simplicity of style, though the author reasonably hopes that older people will use it as a source of information not popularly accessible elsewhere as to the life of Primitive Man and its relation to our own. This book, if the time has come for the public to take to it, will have a certain effect in the world. It is not a mere compilation from the authors mentioned in the preface, but takes its own ground and stands by itself and for itself. Mr. Clodd has thought out his philosophy of life, and used his best skill to bring it into the range of a child's view."—E. B. TYLOR, F.R.S., in *NATURE*

"I read your little book with great pleasure. I have no doubt it will do good, and hope you will continue your work. Nothing spoils our temper so much as having to unlearn in youth, manhood, and even old age, so many things which we were taught as children. A book like yours will prepare a far better soil in the child's mind, and I was delighted to have it to read to my children."—Letter from Professor MAX MÜLLER to the Author

MACMILLAN & CO., LONDON

HOLLOWAY'S OINTMENT and PILLS.

"The long list of deaths among the aged and feeble, daily chronicled, startles the most unfeeling reader, whilst it admonishes thinkers to seek safe means of instantly meeting disordered action, of arresting its progress and repairing its damages. In the chest complaints, catarrhs, colds, and influenza, which are now epidemic, Holloway's Ointment should be well rubbed upon the chest, both before and behind, night and morning. The bowels should be slightly relaxed by appropriate doses of his pills. Demulcent drinks, as barley water or linseed tea, should always be at hand, exposure to variations of temperature guarded against, whilst a light cooling diet should maintain the strength. Holloway's remedies are alike available by the poor and rich."

NATURE.—Wanted clean Copies of Nos. 10 and 13. NATURE Office, 29, Bedford Street, Strand, W.C.

LESSONS IN ELEMENTARY ANATOMY By ST. GEORGE MIVART, F.R.S. &c. Lecturer on Comparative Anatomy at St. Mary's Hospital, Author of "The Genesis of Species"

These Lessons are intended for teachers and students of both sexes not already acquainted with anatomy. The author has endeavoured, by certain additions and by the mode of treatment, also to fit them for students in medicine, and generally for those acquainted with human anatomy, but desirous of learning its more significant relations to the structure of other animals.

"It may be questioned whether any other work on anatomy contains so like compact so proportionately great a mass of information."—*Lancet*

"The work is excellent, and should be in the hands of every student of human anatomy."—*Medical Times*

CLARENDON PRESS PUBLICATIONS.

A TREATISE on ELECTRICITY and MAGNETISM. By J. C. Maxwell, M.A., F.R.S., Professor of Experimental Physics in the University of Cambridge 2 vols. 8vo.

ELEMENTS of NATURAL PHILOSOPHY. By Prof. Sir William Thomson, F.R.S., and Prof P G TAIT. Part I 8vo 9s

The GEOLOGY of the VALLEY of the THAMES. By John Phillips, M.A., F.R.S., Professor of Geology in the University of Oxford With Coloured Map and numerous Illustrations 8vo 21s

"It does not often fall to our lot to open a book devoted to Science, and to derive from it the large amount of pleasure, and at the same time of real instruction, which we have found in the pages of this volume"—*Athenæum*

"We believe that the book will remain for a very long time the standard work on geology of the secondary period."—*Pall Mall Gazette*

VESEVIUS. By Professor Phillips. With numerous Maps and Illustrations. Crown 8vo 10s 6d

"Professor Phillips has undertaken to give an authentic history of Vesuvius from the days of Crassus to the end of 1868, and to explain the phenomena of the burning mount on according to the laws of a rigid induction His plan has been successfully carried out, and has resulted in a work of high value"—*Pall Mall Gazette*

DESCRIPTIVE ASTRONOMY. A Handbook for the General Reader, and also for practical Observatory work With 224 Illustrations and numerous Tables By G. F. CHAMBERS, F.R.A.S., Barrister-at-law. Demy 8vo cloth, 856 pp., price 21s

CHEMISTRY FOR STUDENTS. By A. W. Williamson, Phil. Doc, Professor of Chemistry, University College, London. New Edition, with Solutions. Extra fcap 8vo Cloth, price 5s 6d

"A too rare example of what a good elementary text-book in any science ought to be the language brief, simple, exact, the arrangement logical, developing in lucid order principles from facts, and keeping theory always dependent upon observation; a book that keeps the reason of the student active while he strives to master details difficult but never without interest."—*Examiner*

EXERCISES IN PRACTICAL CHEMISTRY. By A. G. Vernon Harcourt, M.A., F.R.S., Senior Student of Christ Church, and Lee's Reader in Chemistry, and H G MADAN, M.A., Fellow of Queen's College, Oxford. Series I, Qualitative Exercises Crown 8vo price 7s 6d Second Edition.

"The volume is intended as a companion to the valuable and suggestive work on 'Theoretical Chemistry,' by Professor Williamson It constitutes a complete guide to qualitative Chemical Analysis Ample instructions are given to the student at every step, and the instructions are further enforced by excellent illustrations The first portion consists of an examination of the principal gases, and of the principal radicals and their salts, whilst the second treats of the systematic analysis of a single salt The appendix contains a variety of useful tables Many useful practical hints are dispersed throughout the volume, which is one worthy in every respect of a place in the Clarendon Press Series"—*Medical Times*.

AN ELEMENTARY TREATISE ON HEAT By Balfour Stewart, LL.D., F.R.S., Professor of Natural History in Owens College, Manchester Extra fcap 8vo with numerous Woodcuts and Diagrams, 7s. 6d. New Edition, revised and enlarged.

"The publication of this manual is exceedingly well-timed, it includes within narrow limits the leading facts and principles of this younger-born of the Sciences, and for the mastery of the greater portion of the contents only requires ordinary intelligence on the part of the reader"—*Spectator*

FORMS OF ANIMAL LIFE. Being Outlines of Zoological Classification Based upon Anatomical Investigation, and Illustrated by Descriptions of Specimens and of Figures. By GEORGE ROLLESTON, M.D., F.R.S., Lunatic Professor of Physiology, Oxford Demy 8vo. price 16s.

"Teacher and student alike will rejoice over this volume It supplies us in a thorough, yet easily-mastered, manner, with a vast amount of precise and important information concerning the structure of all animals save man, the descriptions being drawn in order from every sub-kingdom and each class of the animal world."—*Spectator*.

"A book of the highest character and value."—*Athenæum*.

A TREATISE ON ACOUSTICS. By W. J. Donkin, F.R.S., Savilian Professor of Astronomy in the University of Oxford Crown 8vo price 7s. 6d

A SYSTEM OF PHYSICAL EDUCATION: Theoretical and Practical, with numerous Illustrations drawn by A. Macdonald, of the Oxford School of Art. By ARCHIBALD MACLAREN, The Gymnasium, Oxford. Extra fcap. 8vo. price 7s 6d

"The work before us is one which should be in the hands of every schoolmaster and schoolmistress. It is marked in every line by good sense, and is so clearly written that no one can mistake its rules."—*Leader*.

A TREATISE ON NATURAL PHILOSOPHY. By Sir William Thomson, F.R.S., Professor of Natural Philosophy in the University of Glasgow, and P G TAIT, M.A., Professor of Natural Philosophy in the University of Edinburgh Volume I [A New Edition in the Press]

MACMILLAN & CO., LONDON.

THE JOURNAL OF APPLIED CHEMISTRY.

A MONTHLY PUBLICATION OF 16 PAGES QUARTO.

Devoted to Chemistry as applied to Arts and Manufactures, Agriculture, Metallurgy, &c. &c.

At Two Dollars and Twenty-five Cents per annum, or One Dollar and Seventy-five Cents paid strictly in advance, including postage to United Kingdom.

Each number contains Original Articles on General Chemistry applied to Arts and Manufactures, Matter on Particular Fabrications, as Petroleum, Soap, Tanning, Dyeing, and numerous others.

A suitable space is also devoted to Practical Recipes and interesting Scientific Facts.

Full and carefully prepared Market Reviews and Prices Current of Drugs and Chemicals of every description are given in each number for New York, Boston, and Philadelphia, with Tables of Imports.

EIGHTH VOLUME, commenced with January number

NEWMAN'S ENTOMOLOGIST.

A MONTHLY ILLUSTRATED JOURNAL OF BRITISH INSECTS

Conducted by EDWARD NEWMAN, F.L.S. F.Z.S. &c.,

Late President of the Entomological Society

The objects of the *Entomologist* are to give every information about Insects, more especially to work out the lines of those which attack Fruit and Forest Trees, Vegetables, Root and Seed Crops, Greenhouses and Garden Plants, with a view to suggesting remedies. Notes, Observations, and Queries on every branch of the science are solicited. To preserve a continuous record of the occurrence of rarities. To improve collections by offering a ready medium for the exchange of specimens.

Published on the First of every Month

PRICE SIXPENCE

SIMPKIN, MARSHALL, and Co., Stationers' Hall Court.

* Subscribers for one year, post free, Six Shillings, payable in advance to Edward Newman, 9, Devonshire Street, Bishopsgate. In Prepayment by the year effectually removes the possibility of irregular delivery by provincial booksellers.

THE ZOOLOGIST.

A MONTHLY JOURNAL OF NATURAL HISTORY

Conducted by EDWARD NEWMAN, F.L.S. F.Z.S. &c.

The *Zoologist* was established in 1845 to record and preserve observations on subjects similar to those treated of in White's "Natural History of Soil-borne," and the success which has attended it is sufficient proof that its plan is acceptable to "out-of-door naturalists," those who delight in observing the manners, habits, the private lives, the migrations, movements, nests, young and food of animals. It contains original papers and records of facts relating to Quadrupeds, Birds, Reptiles, Fishes, and Insects, together with notes of recent works on every branch of Natural History. The Editor has been assisted by more than two hundred of our very best zoologists.

Published on the First of every Month.

PRICE ONE SHILLING

London. JOHN VAN VOORST, 1, Paternoster Row

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence monthly, 24 pages 8vo, with occasional illustrations

Conducted by H. G. KNAGGS, M.D. F.L.S., R. MCLEACHAN, F.L.S., E. C. RYE, and H. T. STANTON, F.R.S., &c.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post-free. The volumes commence with the June number in each year.

Vols. I to V. (originally bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 7s. each, the succeeding vols. may be had separately or together at 7s. each.

London. JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

SCIENTIFIC PUBLICATIONS.

This day, in crown 8vo, price 3s. 6d.

THE SPECTROSCOPE AND ITS APPLICATIONS. By J. NORMAN LOCKYER, F.R.S. With Coloured Plate and numerous Woodcuts. Being Vol. 1 of "NATURE SERIES," a Series of Popular Scientific Works now in course of Publication.

THE DEPTHS OF THE SEA: an Account

of the General Results of the Dredging Campaigns of H.M.S. *Porcupine* and *Lightning* during the Summers of 1868, 1869, and 1870 under the Scientific Direction of Dr. Carpenter, F.R.S.; J. Gwyn Jeffreys, F.R.S., and Mr. Wyville Thomson, F.R.S. By Dr. WYVILLE THOMSON, F.R.S., Director of the Scientific Staff of the *Challenger Expedition*. In 8vo, cloth, extra gilt, with nearly 100 illustrations and 8 Coloured Maps and Plans, price 31s. 6d.

"Nothing can be more complete than the account of the scientific results of these voyages, which are fully illustrated by woodcuts of the strange forms of life brought from the dark depths of the ocean, by charts of soundings, and elaborate tables of deep-sea temperature."—*Daily News*

"Looking at the engravings, it is not too much to say that no such illustrations of the peculiarly delicate and complicated forms of lower animal life have yet appeared."—*Limes*

THE FORCES OF NATURE. A Popular

Introduction to the Study of Physical Phenomena. By AMEDEE GUILLÉMIN (translated from the French by Mrs. NORMAN LOCKYER, and Edited with Additions and Notes, by J. NORMAN LOCKYER, F.R.S. Illustrated by 11 Coloured Plates and 455 Woodcuts. Second Edition. Royal 8vo, cloth extra, 31s. 6d.

"Translator and Editor have done justice to their trust. The text has all the force and flow of original writing, combining faithfulness to the author's meaning with purity and independence in regard to idiom, while the technical precision and accuracy pervading the work throughout, speak of the watchful editorial supervision which has been given to every scientific detail. Altogether, the work may be said to have no parallel, either in point of fulness or attraction, as a popular manual of physical science."—*Saturday Review*

THIRD EDITION OF PROF. ROSCOE'S

LECTURES ON THE SPECTRUM ANALYSIS. Revised throughout, with Appendices, Engravings, Maps, and Chromo-Lithographs of the Spectra of the Chemical Elements and Heavenly Bodies. Medium 8vo, cloth extra, 21s.

THE LIFE AND LETTERS OF JAMES

DAVID FORBES, F.R.S., late Principal of the United College in the University of St. Andrews. By J. CAMPBELL SHARP, LL.D., Principal of the United College in the University of St. Andrews, Professor of Art, University of Edinburgh, and A. ADAMS-REILLY, F.R.G.S. With Portraits, Maps, and Illustrations. 8vo, 16s.

"Not only a biography which all should read, but a scientific treatise without which the shelves of no physician's library can be deemed complete."—*Standard*

PROFESSOR HUXLEY'S CRITIQUES

and ADDRESSES. 8vo, 22s. 6d.

CONTENTS.—Administrative Nihilism. The School Board, what They can Do and What They May Do. On Medical Education. Yeast. On the Formation of Coal. On Coral and Coral Reefs. On the Methods and Results of Ethnology. On some Recent Points in British Ethnology. Paleontology and the Doctrine of Evolution. Biogenesis and Abiogenesis. Mr. Darwin's Critics. The Genealogy of Animals. Bishop Huxley and the Metaphysics of Sensation.

By the same Author,

VICHY WATERS COMPANY,

27, MARGARET STREET, REGENT STREET, LONDON, W.

DEPOT FOR ALL FOREIGN MINERAL WATERS, VICHY.

The use of the Natural Waters of Vichy is extending vastly. They are most efficacious in all complaints arising from acidity. They make the blood more alkaline and less coagulable, and promote its circulation. In the derangement of the digestive functions, and in all the chronic disorders of the abdominal organs, their good effects are shown. The Waters of Vichy are alkaline and gaseous, and although medicinal they are agreeable to the palate, from their slightly acid taste. Of all mineral waters they are the most exported.

LADIES' EDUCATIONAL ASSOCIATION.

in connection with University College, London

The Day Classes for Ladies, at University College, will open Monday, October 27

The subjects for this Session are English Literature, French Literature, Composition, and Grammar, Italian and German Languages and Literature, Logic, Physiology and Hygiene, French History, English Constitutional History, Mathematics (ratio and proportions), Practical Physics and Architecture.

Prospectuses to be had in the office of the College, or of J. E. Mylne, Esq., 47, Oxford Square, Hyde Park, W.

WORKING MEN'S COLLEGE.

GEOLOGY

Mr. J. LOGAN LOBLEY, F.G.S., will commence a Course of Twelve Lectures on Geology, at the Working Men's College, 65, Great Ormond Street, W.C., on MONDAY, October 27th, at 8 p.m.

Terms on application to Mr. J. Rigby Smith, Secretary of the College

SCHOLASTIC or Otherwise.—A Situation

will be required after Christmas by an Analytical Chemist, an F.C.S., well accustomed to Tuition. At present Assistant Chemical Master in a Public School. Highest testimonials, prize medal, &c.—Address—A.F.S., Mr. Billington, Rugby.

MINERALOGY.—Collections of Character-

istic Mineral Specimens for Students preparing for the Examinations, at moderate prices, also Single Specimens, Minerals for Analysis and Chemical Research, Hammers, Models of Crystals, &c., of JAMES B. GREGORY, Mineralogist, 15, Russell Street, Covent Garden, W.C.

WOLLASTON'S REFLECTING GONIO-

METER Wanted, Second-hand. State maker, when bought, price, &c., to "Delta," care of Frederick May, and Son, Advertising Agents, 145, Piccadilly, W.

NATURE.—Wanted clean Copies of Nos.

20 and 13. NATURE Office, 50, Bedford Street, Strand, W.C.

ROYAL COUNCIL OF EDUCATION.—

The Laboratory and Class-rooms of BERNERS College are open for Pupils EVERY DAY and EVENING. The subjects of the above Examinations can be studied either Privately or in Classes. Fees moderate. Analyses and investigations conducted.—Apply to Prof. E. V. GARDNER, F.R.S., F.S.A., 44, Berners Street, W.

ROYAL POLYTECHNIC INSTITUTION,

309, REGENT STREET, W.

LABORATORY and CLASS ROOMS are now open for ANALYSES. Pupils and Class and Private Studies. Investigations connected with Patents Conducted. Classes are now forming in Chemistry, Physics, and Steam.—For Fees and Syllabus apply to the Professor of Chemistry, Scientific Department, Royal Polytechnic Institution.

SCHOOL OF CHEMISTRY,

20, GREAT MARLBOROUGH STREET,
LONDON, W.

DIRECTED BY ARTHUR VACHER, F.C.S.

The Instruction is essentially practical, there are no Lectures. Each Student works independently.

The Course of Study is arranged to qualify the Student as an Analyst and to enable him generally to apply the science to any branch of industry but the Students are free to pursue their own particular object.

The hours are from Ten to Four. On Saturdays the Laboratory is reserved for Ladies.

The Charge is Five Pounds per Month. This includes Instruction, Chemicals, Apparatus, &c. Occasional Students are received at the same rate, namely, Ten Shillings per Month for each Half-day in the Week. Schoolmasters requiring personal instruction pay Half-fees.

KING'S COLLEGE.

EVENING LECTURES

CHEMISTRY—Mr. W. N. HARTLEY

Mondays and Thursdays at 7 o'clock. Fee for the Course, £1 12s 6d

CHEMICAL ANALYSIS—Mr. W. N. HARTLEY

Tuesdays, from 7 till 9 o'clock. Fee, £4 ss.

SCIENCE TUITION BY CORRESPONDENCE.—Mr. ROUTLEDGE, B.Sc. F.C.S., Bowdoin, Cheshire.

MR. MURRAY'S LIST OF FORTHCOMING WORKS.

THE NATIONAL MEMORIAL to the PRINCE CONSORT AT KENSINGTON Illustrated by 24 first-class Engravings in line, mezzotint, colours, and wood, of the Monument, its Architecture, Statues, Moais, &c With descriptive Text. Folio. Price 15 Guinea.

THE EARLY HISTORY of INSTITUTIONS, more particularly as illustrated by the Irish Brehon Law By Sir H SUMMER MAINE, KCST DCL 8vo.

A BRIEF MEMOIR of the PRINCESS CHARLOTTE OF WALES With Selections from her Correspondence By Lady ROSE WEIGALL With an Original Portrait Post 8vo

LIFE and DEATH of BARNEVELD. Including the History of the Primary Causes and Movements of "The Thirteen Years' War" By J. LOTHROP MOILAY, D.C.L., Author of the "Rise of the Dutch Republic," &c With Illustrations 2 vols 8vo.

SCIENTIFIC AND LITERARY SOCIETIES'
LECTURES, MEETINGS, &c.

THE LEEDS

NATURALISTS' FIELD CLUB AND SCIENTIFIC ASSOCIATION

President—THOMAS HICK, B.A. B.Sc.

Founded March 1870, reorganised on a broader basis
March 1872

OBJECTS.—1 The thorough investigation of the Natural History of the West Riding of Yorkshire, more especially of the immediate neighbourhood of Leeds.

2 The cultivation of a taste for Scientific Knowledge (in the widest sense of the term) among the inhabitants of Leeds, the communication and strengthening of individual effort, and the affording facilities for the discussion of papers on scientific subjects.

MEETINGS every Tuesday evening at 8 P.M., at the Mechanics' Institute, free to the public.

FIELD EXCURSIONS during the Summer
Subscription—4s. a year.

During the present quarter the following papers will be read:—

Nov. 11 — "Snakes," by Mr F. GREENWOOD, M.R.C.S.E.

"25 — "The Carboniferous Fauna," by Mr. J. W. DAVIS.

Dec. 9. — "The Study of Microscopical Science," by Mr. F. HAMILTON.

The Meetings on Oct. 7, 21, and 28, Nov. 4 and 18, and Dec. 2, will be devoted to "Exhibitions of Specimens, and Conversation," and the quarter will be closed by a Microscopical Soirée.

The Fauna and Flora of the country within 10 miles of the Town Hall is now in active preparation, and the Council trust that all Naturalists who are able to assist will at once communicate with the Secretaries.

JAMES BRODIE,
W. D. ROEBUCK,

Oct 1873

ROYAL CORNWALL

POLYTECHNIC SOCIETY

In connection with this Society, classes will be carried on during the winter for instruction in the various branches of Drawing, and Courses of Lectures will be delivered upon Chemistry, Physical Geography, as well as occasional Lectures upon other scientific topics.

TO SECRETARIES OF SCIENTIFIC AND LITERARY SOCIETIES.

It having been suggested that the publication of a weekly Diary in NATURE of the Meetings, &c. of the various provincial Scientific and Literary Societies would be found very useful, not only to the members of such Societies, but to all who are interested in scientific and literary subjects, the Publishers have determined to devote a portion of their advertisement columns to this purpose, and to insert NOTICES OF MEETINGS, SUBJECTS OF LECTURES, &c., at the nominal charge of One Shilling for each insertion.

The Publishers of NATURE will be glad if the Secretaries of Societies will aid them in their endeavours to make this weekly Diary as complete and useful as possible. Notices intended for insertion therein must be sent, addressed to the Publishers, by Wednesday Mornings.

Second Edition

HOLIDAYS ON HIGH LANDS: or,
Reminiscences and Incidents in Search of Alpine Plants. By the Rev.
HUGH MACMILLAN, LL.D., Author of "Bible Teachings in Na-
ture," &c. Globe 8vo, 6s.In this edition the author has completed the Journal of his tour in Norway,
which broke off abruptly and was left unfinished in the last, a large amount
of additional information regarding the distribution of British and Norwe-
gian plants, and the geological changes connected with them has also been
incorporated, and several interesting and important facts borrowed from
classic story and from the records of zoology and geology, throwing light
upon these changes have been given. Seventy-four pages of new matter
have been added, and the whole work has been thoroughly revised, and it
is hoped greatly improved.

MACMILLAN & CO., London.

Lately published, in 18mo, cloth, price 6s. 6d.

With upwards of 400 Illustrations

LESSONS IN ELEMENTARY ANA-
TOMY By ST. GEORGE MIVART, F.R.S. &c., Lecturer on Com-
parative Anatomy at St. Mary's Hospital, Author of "The Genesis of
Species"These Lessons are intended for teachers and students of both sexes not
already acquainted with anatomy. The author has endeavored, by certain
additions and by the mode of treatment, also to fit them for students in medi-
cine, and generally for those acquainted with human anatomy, but desirous
of learning its more significant relations to the structure of other animals."It may be questioned whether any other work on anatomy contains in
like compass so proportionately great a mass of information."—*Lancet*"The work is excellent, and should be in the hands of every student of
human anatomy."—*Medical Times*

HOLLOWAY'S PILLS.—Depression of

Spirits—Some defect in digestion is generally the cause of mental de-
pression. On rectifying the disordered stomach, the long list of
gloomy thoughts ceases, and is succeeded by more hopeful and more
happy feelings. Holloway's Pills have been renowned far and wide for
effecting this dear life change, without unconsciously the morbidly
sensitive or most delicate organism. They remove all obstructions, re-
gulate all secretions, and correct depraved humors by purifying the
blood and invigorating the stomach. Their medicinal virtues reach, re-
fresh, and stimulate every organ, and gladden the body, whereby the
entire system is renovated. No medicine ever before discovered re-
solves so beneficially upon the blood and circulation as Holloway's celebrated
Pills.

VI.

CURIOUS FUGITIVE AND INEDITED PIECES.

VII.

CURIOSITIES of LITERATURE, and ODDITIES of HUMAN LIFE and CHARACTER.

It has been the desire of the Editor, by this work—while not discouraging the progressive spirit of the age—to temper it with affectionate feelings towards what is poetical and elevated, honest and of good report in the old national life, while in no way discountenancing great material interests, to evoke an equal activity in those feelings beyond self, on which depend remoter but infinitely greater interests, to kindle and sustain a spirit of patriotism, tending to unity, peace, and prosperity in our own estate, while not exclusive of feelings of benevolence, as well as justice, towards others. It has been, further, the desire of the Editor that these volumes should be a repertory of old fireside ideas in general, as well as a means of improving the fireside wisdom of the present day.

CLARENDON PRESS PUBLICATIONS.

A TREATISE on ELECTRICITY and MAGNETISM. By J. C. Maxwell, M.A., F.R.S., Professor of Experimental Physics in the University of Cambridge 2 vols. 8vo.

ELEMENTS of NATURAL PHILOSOPHY. By Prof. Sir William Thomson, F.R.S., and Prof. P. G. TAIT. Part I 8vo 9s.

The GEOLOGY of the VALLEY of the THAMES. By John Phillips, M.A., F.R.S., Professor of Geology in the University of Oxford With Coloured Map and numerous Illustrations 8vo 21s.

"It does not often fall to our lot to open a book devoted to Science, and to derive from it the large amount of pleasure, and at the same time of real instruction, which we have found in the pages of this volume."—*Athenæum*.

"We believe that the book will remain for a very long time the standard work on geology of the secondary period."—*Full Mall Gazette*.

VESUVIUS. By Professor Phillips. With numerous Maps and Illustrations. Crown 8vo 10s 6d.

"Professor Phillips has undertaken to give an authentic history of Vesuvius from the days of Crassus to the end of 1868, and to explain the phenomena of the burning mountain according to the laws of a rigid induction. His plan has been successfully carried out, and has resulted in a work of high value."—*Full Mall Gazette*.

DESCRIPTIVE ASTRONOMY. A Handbook for the General Reader, and also for practical Observatory work. With 224 Illustrations and numerous Tables. By G. F. CHAMBERS, F.R.A.S., Barrister-at-law. Demy 8vo, cloth, 856 pp., price 21s.

CHEMISTRY FOR STUDENTS. By A. W. Williamson, Phil. Doc., Professor of Chemistry, University College, London. New Edition, with Solutions. Extra fcap 8vo (cloth, price 8s 6d).

"A too rare example of what a good elementary text-book in any science ought to be: the language brief, simple, exact, the arrangement logical, developing in lucid order principles from facts, and keeping theory always dependent upon observation; a book that keeps the reason of the student active while he strives to master details difficult but never without interest."—*Examiner*.

EXERCISES IN PRACTICAL CHEMISTRY. By A. G. Vernon Harcourt, M.A., F.R.S., Senior Student of Christ Church, and Lee's Reader in Chemistry, and H. G. MADAN, M.A., Fellow of Queen's College, Oxford. Series I., Qualitative Exercises. Crown 8vo price 7s 6d. Second Edition.

"The volume is intended as a companion to the valuable and suggestive work on 'Theoretical Chemistry,' by Professor Williamson. It constitutes a complete guide to qualitative Chemical Analysis. Ample instructions are given to the student at every step, and the instructions are further enforced by excellent illustrations. The first portion consists of an examination of the principal gases, and of the principal radicles and their salts, whilst the second treats of the systematic analysis of a single salt. The appendix contains a variety of useful tables. Many useful practical hints are dispersed throughout the volume, which is one worthy in every respect of a place in the Clarendon Press Series."—*Medical Times*.

AN ELEMENTARY TREATISE ON HEAT. By Balfour Stewart, LL.D., F.R.S., Professor of Natural History in Owens College, Manchester. Extra fcap 8vo with numerous Woodcuts and Diagrams, 7s 6d. New Edition, revised and enlarged.

"The publication of this manual is exceedingly well-timed; it includes within narrow limits the leading facts and principles of this younger-born of the Sciences, and for the mastery of the greater portion of the contents only requires ordinary intelligence on the part of the reader."—*Spectator*.

FORMS OF ANIMAL LIFE. Being Outlines of Zoological Classification Based upon Anatomical Investigation, and Illustrated by Descriptions of Specimens and of Figures. By GEORGE ROLLESTON, M.D., F.R.S., Linacre Professor of Physiology, Oxford. Demy 8vo, price 16s.

"Teacher and student alike will rejoice over this volume. It supplies us in a thorough, yet easily-mastered, manner, with a vast amount of precise and important information concerning the structure of all animals save man, the descriptions being drawn in order from every sub-kingdom and each class of the animal world."—*Spectator*.

"A book of the highest character and value."—*Athenæum*.

A TREATISE ON ACOUSTICS. By W. J. Donkin, F.R.S., Savilian Professor of Astronomy in the University of Oxford. Crown 8vo, price 7s 6d.

A SYSTEM OF PHYSICAL EDUCATION: Theoretical and Practical, with numerous Illustrations drawn by A. Macdonald, of the Oxford School of Art. By ARCHIBALD MACLAREN, The Gymnasium, Oxford. Extra fcap 8vo, price 7s 6d.

"The work before us is one which should be in the hands of every schoolmaster and schoolmistress. It is marked in every line by good sense, and is so clearly written that no one can mistake its rules."—*Lancet*.

A TREATISE ON NATURAL PHILOSOPHY. By Sir William Thomson, F.R.S., Professor of Natural Philosophy in the University of Glasgow, and P. G. TAIT, M.A., Professor of Natural Philosophy in the University of Edinburgh. Volume I. [A New Edition in the Press.]

MACMILLAN & CO., LONDON.

SCIENTIFIC AND LITERARY SOCIETIES'

LECTURES, MEETINGS, &c

TORQUAY

NATURAL HISTORY SOCIETY.

Programme of Lectures to be delivered on Mondays during the Session 1873-4, at the Museum, Park Place, Commencing precisely at Twelve at Noon, and closing precisely at One o'clock.

- Nov. 3.—Introductory Address, by Rev T. R. R. STEBBING, M.A., President.
 „ 10.—“Ferns,” by Dr WILKS.
 „ 17.—“The Flint Implements found in Kent's Cavern,” by W. PENGELLY, F.R.S., &c
 „ 24 & Dec 1.—“The Catacombs of Rome” (two lectures), by Rev W. R. BROWNING, M.A.
 Dec 8.—“The Time of Pericles,” by Rev G. C. SWAYNE, M.A.
 „ 15.—“Aquatic Birds and Naval Architecture,” by S. RHIND.
 „ 22 & 29.—“Electricity and Magnetism” (two lectures; experiments by Mr Viccars), by E. VIVIAN, M.A.
 1874.
 Jan. 5.—“The Greek Lyric Poets,” by Rev G. C. SWAYNE, M.A.
 „ 12.—“The Feudatory Chiefs of India,” by I. B. BOWRING, C.S.I.
 „ 19.—“Sound, scientifically and practically considered,” by W. H. GRATTANN.
 „ 26.—“The Natural History of the Ancients,” by Rev R. CRESSWELL, M.A.
 Feb. 2.—“Witches and Witchcraft,” by Rev G. T. WARNER, M.A.
 „ 9.—“Apes and their Allies,” by Dr WILKS.
 „ 16.—“Things convenient for Social Life,” by Rev. Treasurer HAWKES, M.A.
 „ 23.—“The Life and Songs of Theodore Körner,” by W. H. GRATTANN.
 March 2.—“The Picturesque,” by E. VIVIAN, M.A.
 „ 9.—“Physiology of the Brain,” by Dr WILKS.
 „ 16.—“Myosore,” by L. B. BOWRING, C.S.I.
 „ 23.—“Characteristics of Language,” by Rev. G. C. SWAYNE, M.A.
 „ 30.—“Some Etymologies,” by Rev. S. C. DAVIS, M.A.
 April 6.—“Fossil Organic Remains,” by W. PENGELLY, F.R.S., &c
 „ 13.—“The Ear, its Construction and Adaptation in Man and Lower Animals,” by Dr C. PAGLI BLAKE.
 „ 20.—“The Panjab,” by I. B. BOWRING, C.S.I.
 „ 27.—“Mont Blanc and its attendant Mountains,” by Dr WILKS.

Monthly Meetings of the Members, for reading and discussing Original Papers, are held at the Museum, at 8 p.m., and on the second Wednesday in every Month.

WM. PENGELLY, Hon. Sec.

NOTTINGHAM

LITERARY AND PHILOSOPHICAL SOCIETY

Tenth Session, 1873-74

President—Rev J. F. McCallan, M.A.

- Oct 23.—Conversation in the Rooms of the Art Museum
 „ 30.—Inaugural Address by the President
 Nov. 13.—Illustrated Lecture by J. M. WILSON, M.A., &c, of Rugby, on “The Sun.”
 „ 27.—Lecture by A. S. WILKINS, M.A., Professor of Latin and Comparative Philology at Owens College, on “The Legend of Language.”
 Dec 11.—Lecture by T. APPERLY STEPHENSON, M.D., on “Lord Lytton and his Works.”
 „ 18.—Lecture by E. J. LOWY, F.R.S., on “Scientific Researches.”

A. IRVING, Hon. Sec.

The Natural Science Section holds its meetings in the Society's room on alternate Fridays, at 8 o'clock.

SOCIETY OF BIBLICAL ARCHÆOLOGY,

9, CONDUIT STREET, W.

On Tuesday, November 4, at 8.30 p.m., the following papers will be read—“On Fragments of an Inscription giving part of the Chronology from which the Canon of Berosus was copied,” by GEO. SMITH. “On a new Fragment of the Assyrian Canon belonging to the Reigns of Tiglath-Pileser and Shalmaneser,” by GEO. SMITH.

W. R. COOPER, Secretary.

THE LIVERPOOL

SCIENCE-LECTURE ASSOCIATION.

President—THE MAYOR OF LIVERPOOL.

Session First, 1873-4

The Committee have arranged for the following Lectures to be delivered during the ensuing Session—

- Nov 12.—“On Spectrum Analysis and some of its Applications,” giving special attention to the astronomical results illustrated with the electric light and diagrams. By Dr HUGGINS, F.R.S., &c.
 Dec. 19.—“On Kent's Cavern, near Torquay, Devonshire,” by WILLIAM PENGELLY, F.R.S., &c. Mr. Pengelly has devoted several years in exploring this cavern and bringing to light its prehistoric remains.
 1874.
 Jan. 14.—“On the Analogy of Light and Sound,” by Prof. W. F. BARRETT, F.R.S. Illustrated with numerous experiments.
 Feb. 21.—“On Recent Advances in Solar Physics,” by J. NORMAN LOCKYER, F.R.S., &c. With electrical illustrations.
 March 12.—“On Radiant Light and Heat,” by Prof. BALFOUR STEWART, F.R.S., &c. Professor of Natural History in Owens College, Manchester. Illustrated with the electric light and by numerous experiments.

The Lectures will commence at half-past 7 p.m. precisely, in the Concert Room, St. George's Hall.

Season Tickets for ladies and gentlemen, price 8s. 6d. each, entitling the holders to reserved seats, may be obtained by application to the Secretary or to the Treasurer, Mr. James N. Shoolbrooke, C.E., 3, York Buildings, Dale Street, Liverpool. The seats will be reserved only until 7.25 p.m.

Single Tickets, unreserved seats, Two Shillings each, may be had from the above, or from William Potter, 30, Exchange Street, East, Rockliff Bros. 44, Castle Street; A. Abraham and Co., Opticians, 20, Lord Street, Clay and Abraham, 87, Bold Street, Mott and Sons, 32, Church Street.

ISAAC ROBERTS, F.G.S., Hon. Sec.

26, Rock Park, Rock Ferry.

TO SECRETARIES OF SCIENTIFIC AND LITERARY SOCIETIES.

It having been suggested that the publication of a weekly Diary in NATURE of the Meetings, &c. of the various provincial Scientific and Literary Societies would be found very useful, not only to the Members of such Societies, but to all who are interested in scientific and literary subjects, the Publishers have determined to devote a portion of their Advertisement columns to this purpose, and to insert NOTICES OF MEETINGS, SUBJECTS OF LECTURES, &c., at the nominal charge of one shilling for each insertion.

The Publishers of NATURE will be glad if the Secretaries of Societies will send them in their endorsements to make this weekly Diary as complete and useful as possible. Notices intended for insertion therein must be sent, addressed to the Publishers, by Wednesday Mornings.

OFFICE—29, BEDFORD STREET, STRAND

MACMILLAN AND CO'S ANNOUNCEMENTS

CONTRIBUTIONS to SOLAR PHYSICS. By J NORMAN LOCKYER, F.R.S.
With numerous Illustrations. Royal 8vo, uniform with Roscoe's "Spectrum Analysis," Thomson's "Depths of the Sea," and Ball's "Mechanics"

CAVE-HUNTING Researches on the Evidence of Caves respecting the Early Inhabitants of Europe By W BOYD DAWKINS, F.R.S. Illustrated Royal 8vo

GLAUCUS, or, the Wonders of the Shore By the Rev. CHARLES KINGSLEY
With numerous Coloured Illustrations New and Revised Edition Crown 8vo [Just ready]

FIRST PRINCIPLES of MORAL SCIENCE, or, a First Course of Lectures delivered in the University of Cambridge By the Rev J R BIRKS, Professor of Moral Philosophy Crown 8vo, 8s 6d [Just ready]

HIGHER SCHOOLS and UNIVERSITIES of GERMANY. By MATTHEW ARNOLD, D.C.L. Crown 8vo

COMPARATIVE POLITICS By EDWARD A FREEMAN, D.C.L. Lectures at the Royal Institution. 8vo

HISTORY of the ENGLISH PEOPLE, for the Use of Colleges and Higher Classes in Schools By the Rev J R GREEN, M.A. Crown 8vo

New Volume of Macmillan's Scientific Class Books

STEAM. By J. Perry, Assistant Master at Clifton College

The PRINCIPLES of SCIENCE. By W Stanley Jevons, Professor of Logic in Owens College, Manchester

The PHYSIOLOGY of the CIRCULATION in PLANTS, in the LOWER ANIMALS. and in MAN By J BELL FEFIGREW, M.D., F.R.S., with 150 Engravings on Wood Second Edition, 8vo

A HISTORY of the MATHEMATICAL THEORIES of ATTRACTION and the Figures of the Earth from the time of Newton to that of Laplace By I IODHUNTER, M.A., F.R.S. 2 vols. 8vo

The THEORY of EVOLUTION of LIVING THINGS, and the APPLICATION of the Principles of Evolution to Religion, considered as illustrative of the Wisdom and Benevolence of the Almighty By the Rev G HILNSLOW, M.A., F.R.S. [Just ready]

SIMPLE PRACTICAL METHODS of CALCULATING STRAINS on GIRDEKS, ARCHES, and TRUSSES, with a Supplementary Essay on Economy in Suspension Bridges By L W YOUNG, Associate of King's College, London, and Member of the Institute of Civil Engineers 8vo

A MANUAL of the CHEMISTRY of the CARBON COMPOUNDS, or, Organic Chemistry By C SCHORLEMMER, F.R.S. 8vo

New Volumes of "Nature" Series.

The ORIGIN and METAMORPHOSES of INSECTS By Sir JOHN LUBBOCK, F.R.S. With numerous Illustrations Crown 8vo [Just ready]

The BIRTH of CHEMISTRY. By G. F. Rodwell, F.C.S. With numerous Illustrations. Crown 8vo
